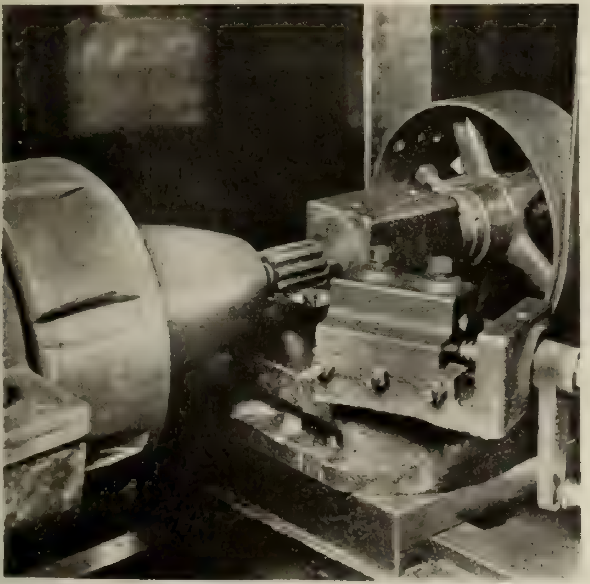
4.5 Mark VII Plant For Sale

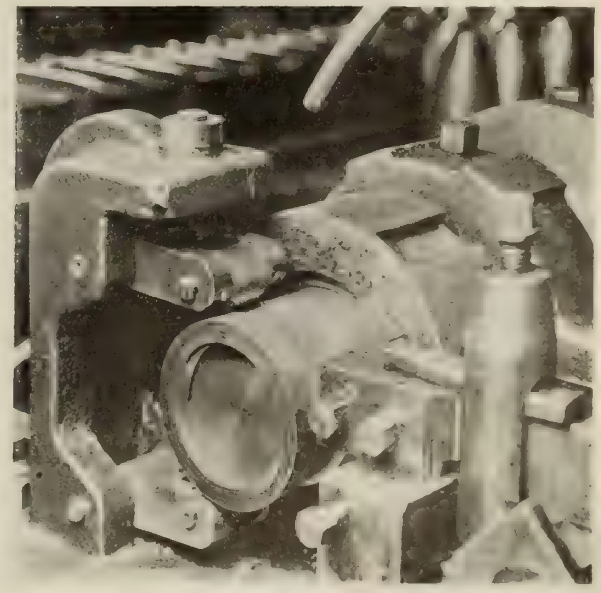
Immediate Delivery

The following machines have been changed from the mark V shell to the mark VII. We will dispose of these machines with their tooling. Every machine has been examined and put into first-class shape.

3—30" American Turret Lathes, Triple Geared; 36" turret base; will take both 3" and 4" boring bars; extension heads on turrets; special small turret or cross-slide with six 1½" holes; 20" 3 jaw Universal steel chucks; Power Feed and Power Reverse. All tooled, boring bars, pot chuck, etc., each	$1300
1—22" x 10' Pond Engine Lathe; back geared and screw feed. All tooled for outside profile operation on Mark VII. shell	$525
1—22" x 10' London Single Drive Engine Lathe; quick change gear box with screw and rod feed. All tooled for outside profile operation on Mark VII. shell	$700
1—24" x 10' Lodge & Barker Back Geared Engine Lathe; screw feed. All tooled for outside profile operation on Mark VII. shell	$500
2—24" Morse Turret Lathes; with 3-jaw Universal chuck; 16" base turret having six 3" holes. All tooled, with pot chuck, for hogging-out base of Mark VII. shell, each	$800
1—Jenckes Band Turning Machine; collet chuck. This machine has band-turned about 15,000 shells. All tooled for Mark VII. shells	$900
1—24" x 12 Bertram Engine Lathe, all tooled with special milling fixture for threading the base recess of Mark VII. shell	$900
2—24" Morse Special Turret Lathes; carriage feed; all tooled with pot chuck and forming tool for finish base recess of Mark VII. shell, each	$900
1—4.5 Brown-Boggs Marking Machine, latest model. New	$200
1—Special Painting Machine, with 110 volt alternating current motor	$50
30—4.5 Shell Platforms with tops holding 50 shells each	$4
1—150-ton Hydraulic Nosing Outfit, consisting of 1 Triple Action Pump (Perrin); 1 Accumulator (Perrin); 1 Nosing Press (Perrin), with Mark VII. die complete; 1 Chapman Banding Attachment for Press	$1075
1—Roelofson Band Turning Lathe, suitable for undercutting, grooving, or similar operations. This machine has a collet chuck	$450



The only correct time to perform the seating operation is to do it in the same fixture with the milling operation. This fixture will fit any engine lathes, and costs only $120.00. The angle of seating can never vary.



Most of the British Shells may now be knurled. This fixture is quick in operation and most accurate. The cost is only $100.00, and it can be used as an attachment to almost any lathe.

We have all gauges for both Mark V and Mark VII Shells, consisting of plug, length, outside diameter, form, thread and seating gauges.

Our Nosing Die Outfit is the best for the Mark VII shell. Leading manufacturers, such as P. L. Robertson Co., Milton; Wilford & Co., Lindsay; Manitoba Engines, Ltd., Brandon; Canadian Westinghouse, Hamilton; Vancouver Engineering Works; Vulcan Iron Works; Otis Fenson Elevator, etc., are using our dies.

Toronto Type Foundry Company, Limited

50 Coleman Avenue, TORONTO, ONT.

Canadian Machinery BUYERS DIRECTORY

If what you want is not listed here write us, and we will tell you where to get it. Let us suggest that you consult also the advertisers' index facing the inside back cover, after having secured advertisers' names from this directory. The information you desire may be found in the advertising pages. This department is maintained for the benefit and convenience of our readers. The insertion of our advertisers' names under proper headings is gladly undertaken, but does not become part of an advertising contract.

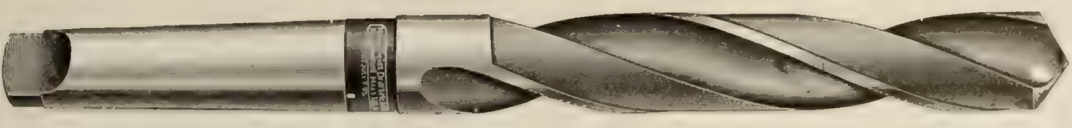
DOING THEIR BIT



IS WHAT "MORSE" DRILLS ARE FAMOUS FOR. EVERYWHERE YOU WILL FIND THEM WORKING MOST EFFICIENTLY. SO WELL AND SO LONG HAVE THEY DONE THIS THAT WHEN A MACHINIST SEES AN EQUIPMENT OF THEM HE KNOWS THAT AT LEAST HIS DRILLING TROUBLES ARE BEHIND HIM. "MORSE" MEANS SERVICE EVERY TIME.

Cut shows Chuck on nosing operation. This is one of over two hundred in this Canadian plant.

This chuck is *built on the duplicate part system. It is simple, effective and fool-proof.*

It grips the shell in a predetermined position. The jaws will not slip on the shell. It has shell interior and exterior adjustable stops.

A trial on one of your lathes will convince you that this is THE Chuck for shell work.

A Big Efficiency Unit in Your Shell Plant

A. J. LAVOIE'S

LOW PRESSURE

Compressed Air Chuck

This chuck can be applied to any make of lathe, without alteration to the machine, and will increase production from 25% to 75%. It grips and releases the shell while in motion—no need to stop your machine.

It is a single unit combination attached to the face plate of lathe, supported by an additional heavy duty bearing, thus making a heavy duty lathe out of a light machine. A small lever operates the chuck. Will operate with a pressure of 60 lbs. per sq. in.

MANUFACTURED BY:

The Montreal General Tool Co.
673-5 Notre Dame Street, Maisonneuve, Montreal, P.Q.

Also manufacturers of shell tools, and special machine attachments of all kinds made to order.

"Victor"
COLLAPSIBLE TAPS

"Ideal for Tapping Shells"

Save the time now WASTED in backing out a few seconds each time, those seconds total a substantial amount in a week's work.

These taps are strong and durable and are made from the best materials obtainable. The bodies are machine steel, and the chasers best grade high-speed steel. Simple in construction, the taps are easy to set; screw adjustment from the front end maintains close accuracy; automatic trip reset by lever; adjustment at rear end regulates spring tension. Sizes 1 to 12 inches, any pitches. By adjustment they can be made to cut standard, large or small threads.

USED BY MANY OF THE LARGE SHELL MANUFACTURERS.

Write for circular. A post card will do.

Victor Tool Company
Waynesboro, Pa., U.S.A

Preparedness—

THE watchword of the day. Start now and be ready for the big business that is coming.

SPECIAL machinery and equipment is our forte. We ask the opportunity of having our engineers solve your problems.

Ribbing up the Liberal Party

HUNDREDS of men whom you know and sell to are tremendously interested either as supporters or opponents in the future of the Liberal party—in its policies, politics, and leaders. And these hundreds of men—Conservatives and Liberals alike—will want to read Gadsby's "inside" story of what is going on behind the scenes in the ranks of Liberalism in Canada.

Gadsby is "next" to big men at Ottawa and elsewhere. His ear is to the ground all the time. He is a pungent writer with a most incisive style, and he fairly scintillates in his article in the October MACLEAN'S—"Ribbing Up the Liberal Party."

This article will be followed in the November issue by another "inside" story of doings and movements in the Conservative party. Read the first of the series in

MACLEAN'S MAGAZINE

for October

Some Toronto Liberals are bent on pushing Mr. Rowell, leader of the Ontario Opposition, to the front—as Sir Wilfrid's successor. And Gadsby reveals a great deal else of sensational interest. You can "cash in" on his article in **MacLean's**.

Other Good Things in the October MacLean's

Is Permanent Peace Possible?—by Stephen Leacock (in the role of a professor of political economy). Frequently Leacock doffs the mantle of the humorist, and dons his academic gown and speaks with an earnest seriousness—as a student, teacher and deep thinker. In this article, Is Permanent Peace Possible? he writes to make men and women think.

The Presidential Situation in the U.S.A.—by Agnes C. Laut. Miss Laut says that the German-Americans will support Wilson rather than Hughes, and gives her reasons. This is quite a contrary view to that commonly held, for we all know that the Hyphenates were "sore" on Wilson a few months ago. What has changed them? Miss Laut tells.

The Man from Athabasca by Robert W. Service. Another "At the Front" poem by this Kipling of Canada. The stirring tale in verse of an old Athabasca trapper who left the hunting grounds of the Far West to do his bit in France and Flanders. A fine thing, this poem, admirably illustrated.

Present-Day Stage Favorites in London—tells of London's play-people who are entertaining the Canadian soldiers in London, at the camps and in the hospitals. Profusely illustrated.

Arthur Stringer and Arthur E. McFarlane continue their fine serials The Anatomy of Love, and Behind the Bolted Door?

Robert J. C. Stead, a young Western poet of great promise, contributes verse entitled "In the Wheat."

"Janey Canuck," Canada's First Woman Magistrate a sketch of Mrs. Arthur Murphy, and incidentally a story of a phase of the Woman's Movement in Western Canada.

Review of Reviews—The best thing from the best periodicals, condensed for busy readers. One of the most prized features of every issue of **MacLean's**.

* * *

THE Mission of MacLean's Magazine is to give the Canadian people a **Canadian** magazine of the highest type and interest and to promote the spirit and progress of Canadian Nationality. Your co-operation in these commendable objects of **MacLean's** publishers is solicited. We have all much to gain by putting Canada first in sentiment, business and affection.

CLEVELAND SAND RAMMERS

FOR FLOOR, BENCH, PEIN AND FLASK RAMMING

Cleveland Sand Rammers are made in several sizes and weights, and are adapted for all kinds of Ramming in general foundry service.

The Piston Rods are packed with a resilient packing that conforms to the shape of Rod without retarding its free action, and prevents any dirt from entering piston chamber and working parts— Rammers are fitted with either Round or Flat Rods as required. Cleveland Rammers are light in weight, have high speed and practically no vibration, making them ideal foundry tools.

Sand Rammer in operation.

CLEVELAND CHIPPING HAMMERS

For General Foundry Work. Are furnished in any required size or weight for grey iron or steel castings; they have high speed, and are particularly adapted for fast chipping now required by piece-work operators.

BOWES AIR HOSE COUPLINGS

Over 1,000,000, in General Use

Bowes Couplings are instantly connected or disconnected.

Bowes Couplings are absolutely air tight under all pressures.

Above cut shows the Never-Slip Clamp attached to Bowes Coupling.

In Stock :—RIVETING HAMMERS, DRILLS, REAMING, TAPPING AND FLUE-ROLLING MACHINES, CORNER DRILLS, PORTABLE AND BENCH GRINDERS, ETC.

Catalog No. 12 mailed on request.

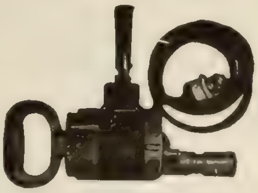
U. S. Electric Drills and Grinders

Save Time, Labor and Money

They can be attached to any lamp socket.

For drilling in metal they are superior to any other kind of portable drill. Cost 50% less to run than air drills.

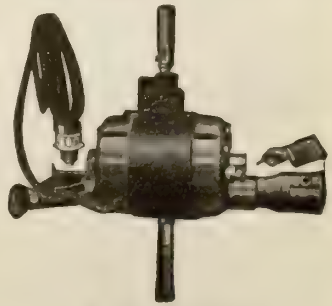


3 SIZES
3-16 inch, W.G.T. 6 lbs.
¼ inch, W.G.T. 9 lbs.
⅜ inch, W.G.T. 12 lbs.

All motors wound for 110 or 220 volts.

Direct or alternating current.

Try a few of our Electric Drills and Grinders and you'll send us an order for more. Our guarantee protects you.



½ inch—2 SPEED.
Speed, 400-750 R.P.M.

"W. & B." Drop FORGINGS

We make a specialty of the highest grade Drop Forgings. Our exceptional capacity and equipment insure accurate forgings and prompt delivery.

The
Whitman & Barnes Manufacturing Co.
Established 1854
St. Catharines, Ontario

Send us Blue Prints on Special Forgings, three pounds and under in weight, and permit us to estimate on your requirements.

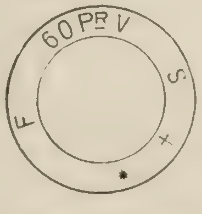
Marking Base of SHELLS

A PERFECT JOB
in 15 Seconds

The "Grant" Shell Marker
is so arranged that the blow is brought to bear on each individual letter successively, while the blow can be adjusted to give a shallow or deep impression which is uniform for each letter or figure. The work is completed in one revolution of the shell, which is done by hand. **Made for 18 pdr., 4.5 in., and 60 pdr. high explosive shells.**

Drop a card for full particulars.

Cut on right shows marking on shell.



THE GRANT MFG. & MACHINE CO.
Holland Ave.
BRIDGEPORT, CONN.
U .S.A.

HIGH SPEED HAMMERS
For High Speed Work

FEATURES:

Our Bench Hammer can be adjusted high or low, and spells another economy in space and handy utility. With it you have a guaranteed saving of from 15% to 20% on any class of work. The life of the machine is practically indefinite as phosphor bronze bushings are used throughout.

No riveting too intricate for us; no riveting which our machine cannot accomplish.

Send for our **High Speed Hammer Book.**

The "HENDEY" Lathe

The Service

Capacity and Convenience

of a Hendey Lathe will prove of vital importance to your tool room.

The "**Hendey**" is accurate in the highest degree and **suited for the efficient use of watch tool chucks, stop chucks, relieving attachments, etc.**

It has the best spindle construction in its taper journals, with annular bearings and automatic oiling rings, which make for accuracy of alignment.

It has **automatic stop** for carriage working in either direction. Has reverse for carriage, controlled from apron.

Wide range of threads and feeds through mounted gearing, with ability to make gear changes for additional threads and feeds without limit.

A card will get you full particulars. Why not mail it now?

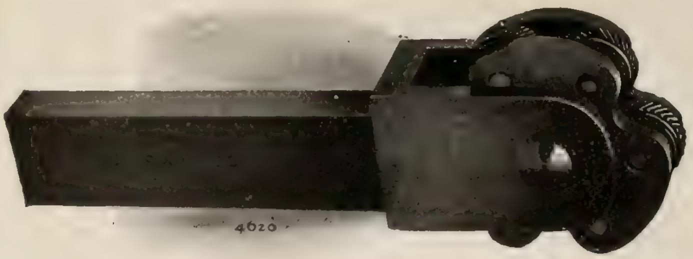
High Speed Steel

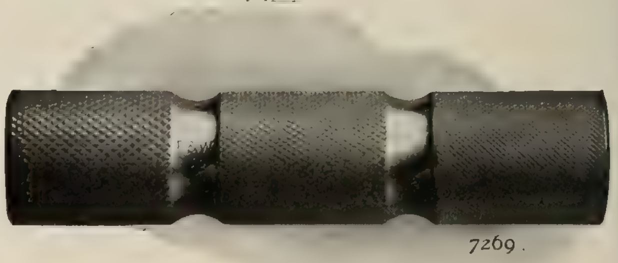
Don't Waste Time Changing Knurls

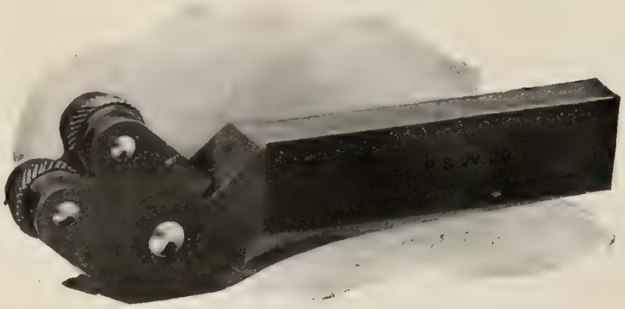
and don't be bothered with three holders when one will do.



Use the P. & W. "Three-in-One" Lathe Knurling Tool

Carries three pairs of knurls, making it three distinct knurling tools in one.





Coarse, Medium and Fine

The three pitches of knurls which we carry in stock are all combined in this one tool.

Uses same knurls as regular Lathe Knurling Tool shown opposite.

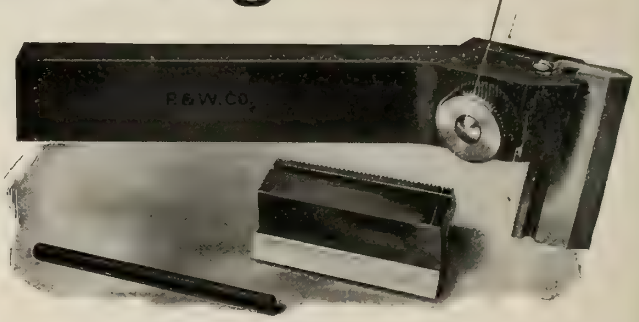
Same Holder for Chasers and Single Point Cutters

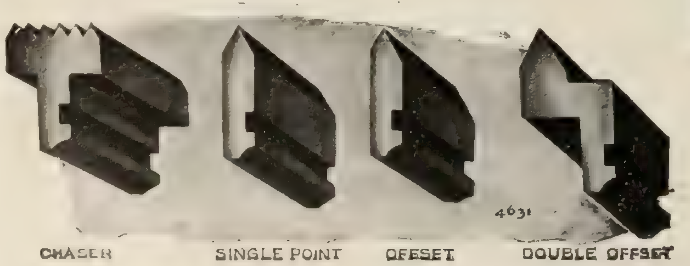
and the change can be made in a jiffy on the

P. & W. Threading Tool

A Few Of Its Advantages

1. Threads can be cut very close to a shoulder.
2. Tools are sharpened by simply grinding off top of cutter.





3. Combines economy with all features essential in a threading and forming tool.
4. Cutters have 15° clearance which experience has taught gives the longest wear in various metals.

Place a trial order with our nearest store.

Coming Events—

THE next Export Number of CANADIAN MACHINERY will be mailed November 2nd. See to it that your message is complete enough to satisfy and convince foreign buyers.

If it requires a page, or two pages, or four pages, to impressively tell your story and to adequately represent your line and your standing, it would be folly to use less.

That's true as applied to Export Numbers, and it's true any time and all the time. A good salesman not only gets the business but he also leaves an impression that's worth real money, and lots of it. A poor salesman leaves a nasty impression and fails to land the business besides.

Forms on our Export Number close Oct. 26th.

Kindly reserve your increased space, and send copy at once.

Quality Service

Courtesy in Business

* * *

Fittingly framed and hanging in the Offices of one of the most important Public Service Corporations on this North American Continent is the following

> **'Did you say Please and Thank you?'**

Broad minded men direct the destiny of that Corporation, men who know that public or private enterprises to be lastingly successful must operate for the public good.

Quality and Service are the two important factors in our business life today, but Courtesy is the door through which they must enter.

We are large producers of Hamilton Pig Iron and our output of Open Hearth Steel Blooms and Billets, Iron and Steel Bars of all shapes and size runs into enormous tonnage.

The products of our mills include practically everything that can be manufactured from Iron and Steel and these we distribute to thousands of satisfied customers.

Our business is an extensive one and a successful one. The World is our market: but our prosperity and success in the future, as in the past, depend upon the continued confidence, co-operation and good-will of the people we serve.

The Steel Company of Canada, Limited

HAMILTON TORONTO MONTREAL WINNIPEG

STELLITE

HIGH SPEED — *TOOL METAL*

MADE IN CANADA
STELLITE

NOT A STEEL

CONTAINS NO IRON

Run your machines faster and get larger production

If your steel tools won't stand faster driving use "Stellite." It won't burn up no matter how fast the machines are driven, for it has no temper. Stellite cuts as well when red hot as when cold. It eliminates the necessity of cutting compound. Increases output 20 to 300 per cent, at no extra cost for equipment.

It is hard. It is tough; use according to directions and it will give you the most startling demonstration of turning you have ever seen.

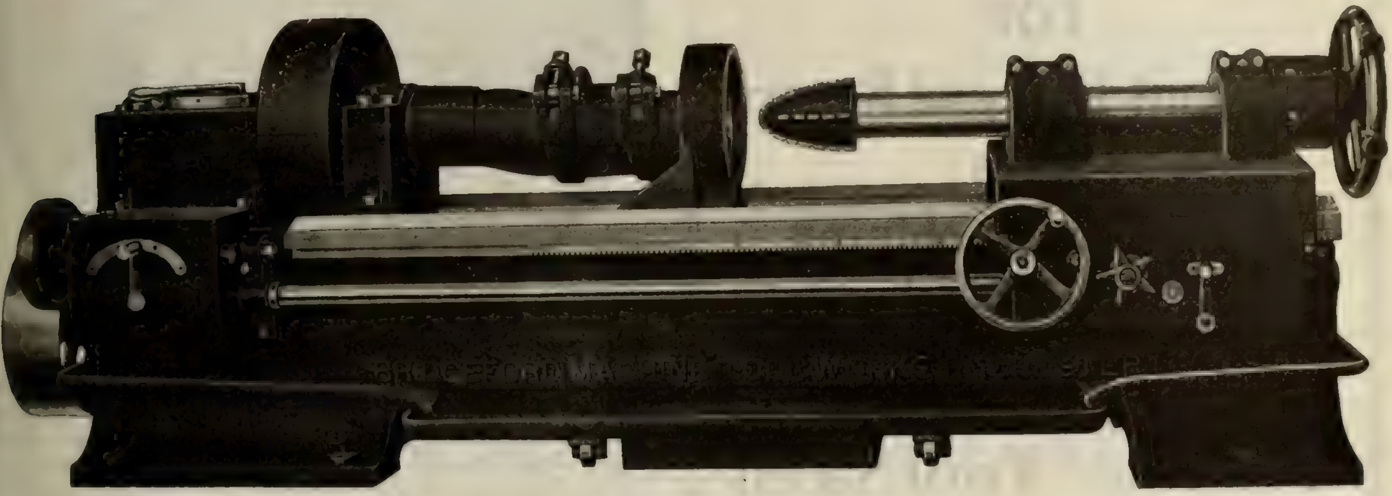
BRIDGEFORD



9.2" Boring Lathe

Massive Strength. This is a machine of ideal proportionate strength, the stresses have been scientifically calculated, the vital points strengthened, resulting in a smooth-running, perfectly balanced unit that ensures efficiency, economy, speed and superior production.

It is a machine of the heavy duty, low swing type, having a specially designed carriage with auxiliary for internal profile. Carries a 6" steel bar with male taper, allowing for light design of cutter heads; 3 automobile style speed changes, all hardened and running in oil bath. A chip tray is attached and used in conjunction with stationary lubricant tank. Regular equipment comprises everything except chuck, steady rest and cutter.

16 in. Lever
POST DRILL

A Giant Little Machine For Light Drilling.

Will drill up to 7/8 inch.

The Feed Lever Socket is adjustable on the feed shaft, to provide for setting the lever in the most convenient position for the operator.

An adjustable friction is provided for the feed shaft, which acts as a balance to the weight of the spindle.

Bevel Gears, Feed Pinion and Rack are all machine cut, working smoothly and without noise.

Drills to centre of 16-inch circle.

Run of feed 5¼ inches.

Greatest distance between drill spindle and table, 22 inches.

Spindle bored for ½-inch shank twist drills.

Speed of countershaft for average work, 300 per minute.

A. B. Jardine & Co.
Hespeler, Ontario

STEEL
for
SHRAPNEL SHELLS
AND SHELL BLANKS

Only Company in Canada producing steel ingots by the "HARMET" Liquid Process.

REASONS WHY THESE INGOTS ARE SUPERIOR TO THE ORDINARY KIND:

1. Prevention of cracks, due to shrinkage; of internal stresses and resulting cracks and fissures.
2. Early cessation in the crystallization of the metal, and the production of fine crystallization of the metal, without cleavage planes.
3. Lessening of segregation, i.e., reduction of tendency to carbon and other impurities to concentrate in the central and upper parts of the ingot.
4. Prevention of "Pipes" or interior cavities, and thus preservation of absolute solidity in the ingot.
5. Improvement in physical properties.
6. Reduction in waste of ingot.

WE CAN SUPPLY FORGINGS OF ALL SHAPES AND SIZES MADE OF ORDINARY OR "HARMET" FLUID COMPRESSED OPEN-HEARTH STEEL ON THE SHORTEST NOTICE.

Speed—Accuracy

—The two most important factors in shell-making. The former is desirable, the latter absolutely necessary. Both are assured by the use of *Jenckes Single Purpose Lathes for Shell Work.*

Illustration shows the latest addition to this famous line—a Banding Lathe for 8" shells. Note the liberal proportions, the general appearance of sturdiness. They mean an extra measure of long and efficient service.

These machines are also manufactured for 18 pdr., 4.5", 5", 6", 8", 9.2" and 12" shells; are tooled when required for the mm. sizes corresponding to Russian and French ammunition.

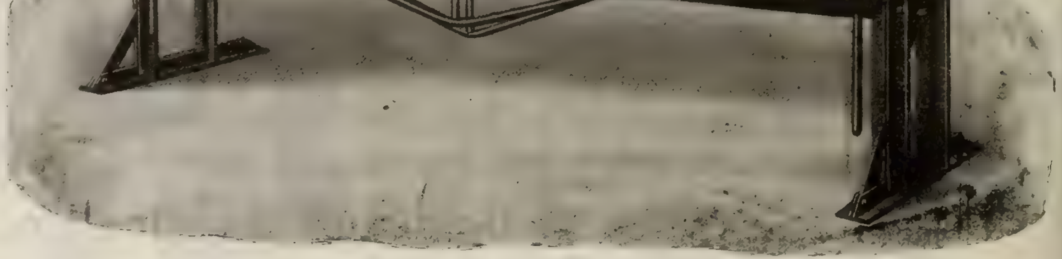
A GOOD INVESTMENT

A "B.B." STEEL BRAKE

FOR a Cheap Brake the "B.B." Steel Plate Machine is the best investment you can make. It is especially designed for rapid forming of sheets, and is suitable for a large variety of work, such as can be accomplished on an ordinary Cornice Brake. We can furnish these Brakes for bending all sizes and gauges of metal.

Write for Catalogue if Interested.



"ALWAYS, EVERYWHERE, SPECIFY 'B.B.' QUALITY."

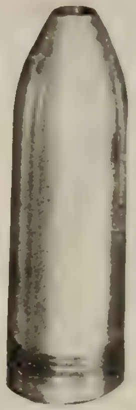
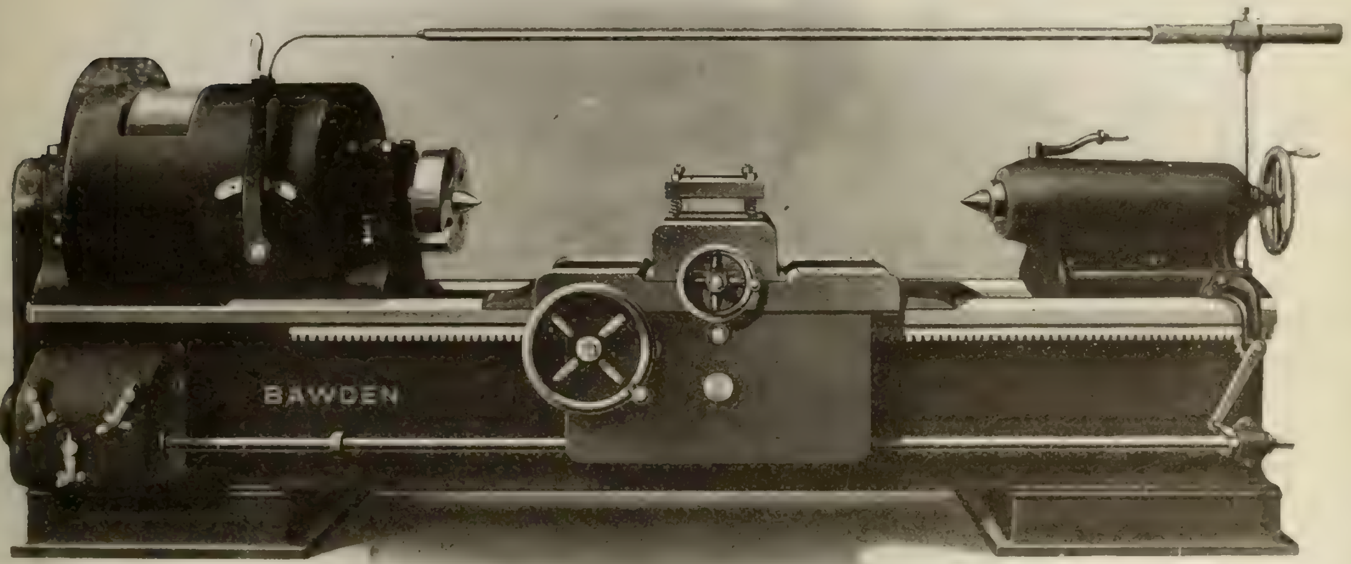
BAWDEN

Heavy Duty Shell Lathe



A Bawden Heavy Duty Shell Lathe restores its cost.



36 in. Triple Geared Lathe for Shells, 8 in., 9 in., 10 in. and 12 in.
24 in., 19½ to 1 Ratio. Back Geared Lathe for Shells up to 6 in.

A Lathe may be an expense—always; or it may save its cost. A Bawden Lathe, in comparison with many Lathes, wipes out its own invoice cost.

The Bawden Lathe for making shells has a rigidity, accuracy, speed and durability under operation that put it in a class by itself. It does its work **right** and **fast**, and so saves time, saves waste, saves temper—all of which have a real money value.

Let us put you in direct communication with Bawden Lathe users. If they like it, they'll say so. If they condemn it, they will not hesitate to give the Bawden kicks and curses.

Send for specifications.

NOTE: We manufacture a full line of Guages for all sizes of British, French and Russian Shells and component parts.

The Bawden Machine Co., Limited

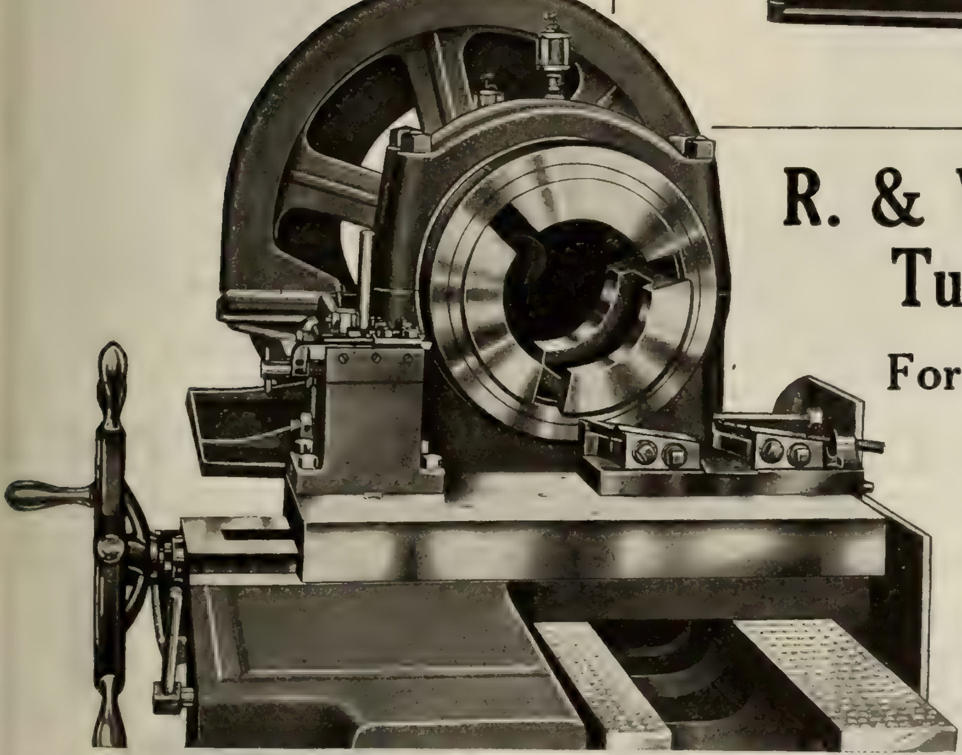
SIDE VIEW



R. & V. Copper Band Turning Lathe

For 6", 8" and 9.2" Shells

Illustration gives view of carriage showing the tool slide with forming tools and trimmer; also chucking collet for holding shell.

WE have brought out a line of Special Single Purpose Lathes for the manufacture of High Explosive Shells, specializing on

Cutting-Off Lathes
Outside Roughing Lathes
Outside Finishing Lathes
Inside Boring Lathes (Roughing and Finishing)
Thread Millers
Turret Lathes for Counterboring
Waving and Undercutting Lathes
Copper Band Turning Lathes
Facing End and to Weight Lathes

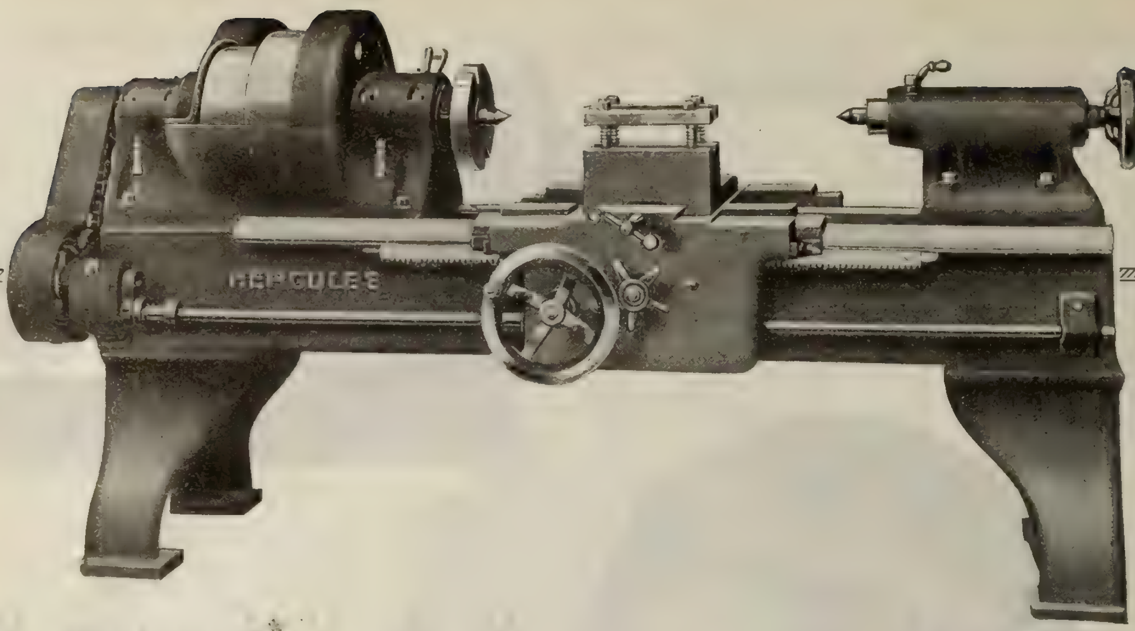
They are all of exceptionally heavy construction and simple design to meet the severe service and special requirements of the Munition manufacturers.

These machines are making records equalled by few, and are already favorably known.

If you are a manufacturer of, or contemplate making shells, write us for estimates and deliveries.

The Root & Vandervoort Engineering Company

EAST MOLINE, ILLINOIS, U.S.A.

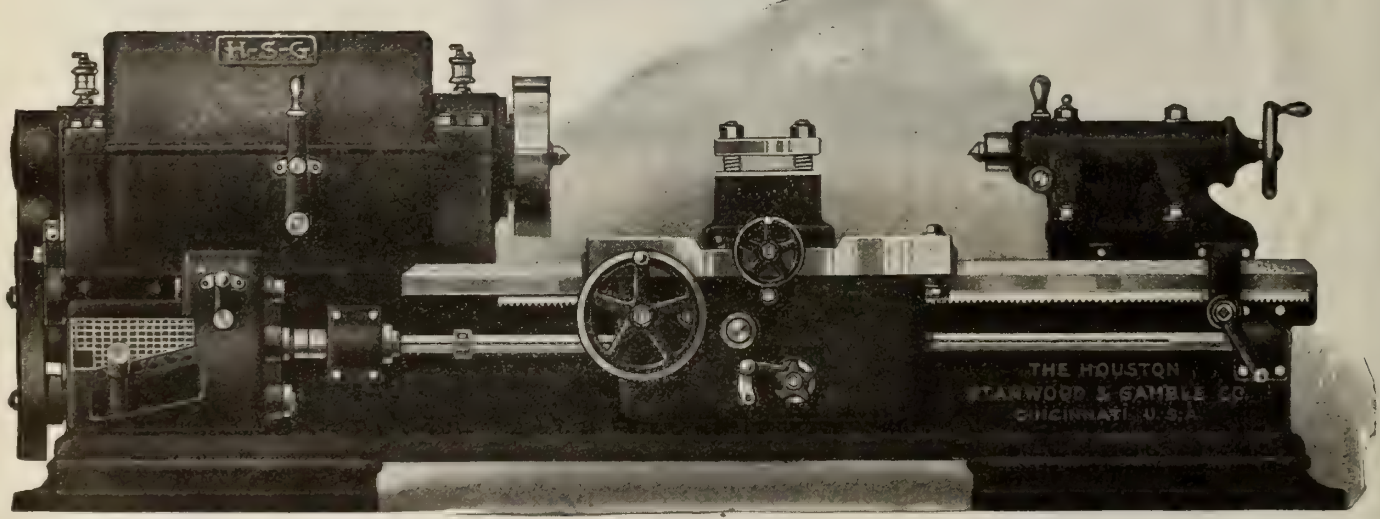


There's Nothing Fancy About the "Hercules," but—

when it comes to turning—well, just watch it. When you have a tough job of straight or taper turning the very absence of frills and special attachments is a decided advantage. That's the idea behind a "Hercules"—a lathe that can handle work requiring sheer strength and power. Its extreme simplicity avoids confusion in operation and facilitates quick handling. When you realize that the majority of lathe work is plain turning, there are possibilities in the "Hercules" well worth considering. Early deliveries. Write us now.

Investigate our Turret Screw Machines

Himoff Machine Co., 128 Mott St., New York City



H-S-G TRADE MARK single-pulley, high-powered, all-geared engine lathe built in three sizes, 28", 30" and 36" swing.

This is a heavy duty lathe. For instance, the 30" swing lathe has 7" face drive pulley, 8" x 10" front spindle bearing and other parts of correspondingly liberal dimensions. The net weight with 13 ft. long bed is 18,500 pounds. The design and workmanship are excellent.

Elmes Hydraulic Press No. 676

With ¾-in. Automatic Lever Operating Valve No. 677-A

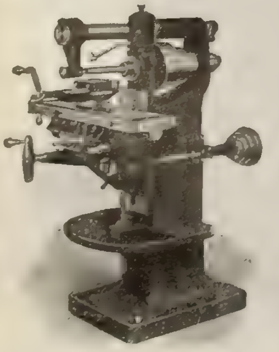
This press is of steel and semi-steel construction, and the stands which support the press are threaded at the ends to receive the steel columns and have holes for fastening to the floor. The platen is guided by the columns.

The operating valve is attached to the cylinder, and is designed with a weight to be set for the pressure desired, and releases automatically. To start the ram up, the lever is pushed down; upon the ram reaching the desired pressure, the lever automatically releases (acting as a safety valve as well), causing the ram to descend. Valve body is made of bronze, and other parts are made of tool steel and machine steel. If desired a hydraulic gauge can be attached to show the various pressures, although with this valve it is not necessary.

Write for our Hydraulic Machinery Catalogue.

Charles F. Elmes Engineering Works 217 N. Morgan St. Chicago, U.S.A.

Over 50 years' experience building hydraulic machinery.



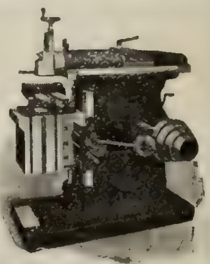
Cut Your Shop Costs

Nobody would think of putting 16-inch lathe work on a 30-inch lathe, then why leave small parts on a large Milling Machine?

A steptoe Hand Miller or small power feed can be handled quickly and will cut your production cost. You will have less money invested in your Milling Machines and have more machines to do the work.

That same principle applied to your small planer work will cut the cost of planer work.

A Steptoe Shaper will do the work faster because it can be handled quicker.



The John Steptoe Company, CUMMINSVILLE CINCINNATI, OHIO, U.S.A.

Shell-Steel Cutting Time on the PEERLESS High Speed Heavy Duty Metal Cutting Saw

Owing to the toughness of this material it was selected for cutting time, and under extreme feed the actual time on cutting 5 in. round is 7¼ min. Regular stock blade was used, 12 x ¾, 18 gauge, 10 pitch.

A machine that will stand up for such heavy duty work must be properly designed and rigidly constructed, and to stand the wear and tear the right grade of material and workmanship must be embodied, and that is just what you will find in the PEERLESS High Speed.

As a real time saver in operating and adjusting, it is in a class by itself. For an example, more than six cuts per minute can easily be made on a ½ in. round cold rolled steel bar. This covers the time in starting and stopping on each cut. The PEERLESS not only saves time, but also increases the production.

Again we say, the actual time saved in operating and adjusting the PEERLESS High Speed is a big item that is well worth investigating.

Again we suggest, before considering any other cutting-off equipment, write us for a complete description.

Cut shows Chuck on nosing operation. This is one of over two hundred in this Canadian plant.

This chuck is *built on the duplicate part system. It is simple, effective and fool-proof.*

It grips the shell in a predetermined position. The jaws will not slip on the shell. It has shell interior and exterior adjustable stops.

A trial on one of your lathes will convince you that this is THE Chuck for shell work.

A Big Efficiency Unit in Your Shell Plant

A. J. LAVOIE'S
LOW PRESSURE
Compressed Air Chuck

This chuck can be applied to any make of lathe, without alteration to the machine, and will increase production from 25% to 75%. It grips and releases the shell while in motion—no need to stop your machine.

It is a single unit combination attached to the face plate of lathe, supported by an additional heavy duty bearing, thus making a heavy duty lathe out of a light machine. A small lever operates the chuck. Will operate with a pressure of 60 lbs. per sq. in.

MANUFACTURED BY

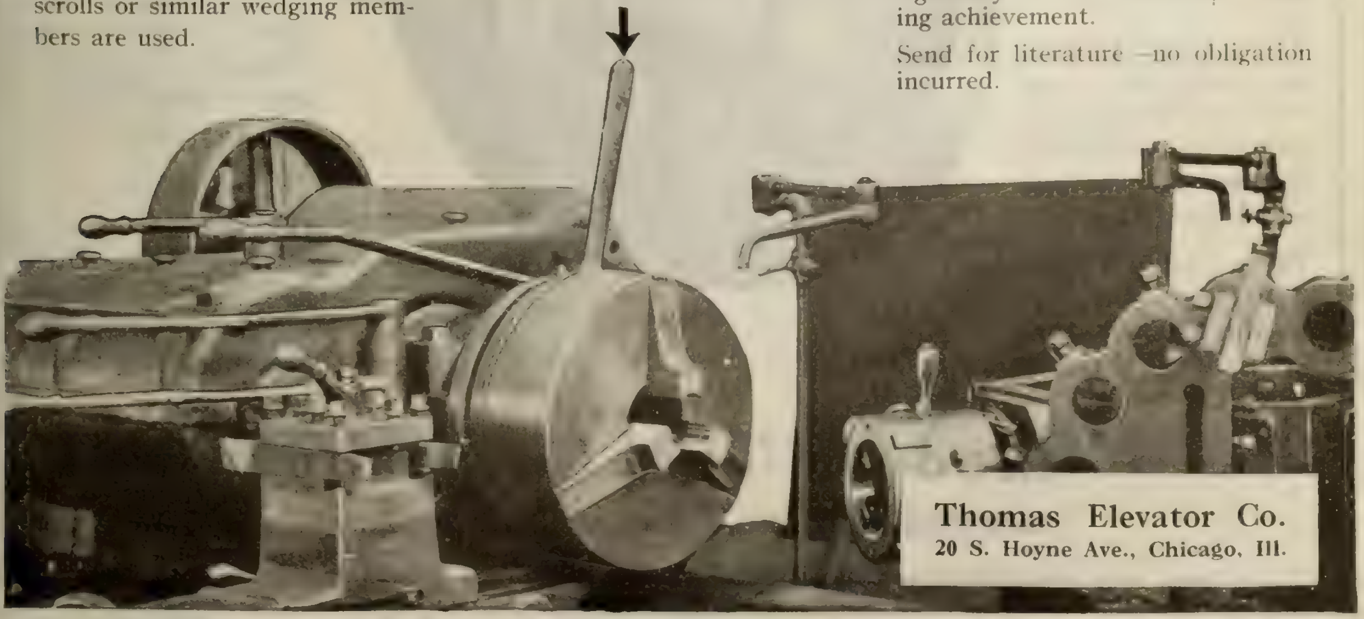
Do Away With Friction Losses in Chucks

by using Barker Wrenchless Chucks

In transmitting the movement from the cam to the jaws of a Barker Wrenchless Chuck a leverage principle is involved which eliminates to a large extent the tremendous frictional loss incurred in chucks where scrolls or similar wedging members are used.

Operating mechanism combined with the chuck proper forms a single unit—no time lost in mounting—quick acting—opened and closed while the machine is in motion—these and many other vital points on this new but established departure in chucks may rightfully be considered a striking achievement.

Send for literature—no obligation incurred.



Thomas Elevator Co.

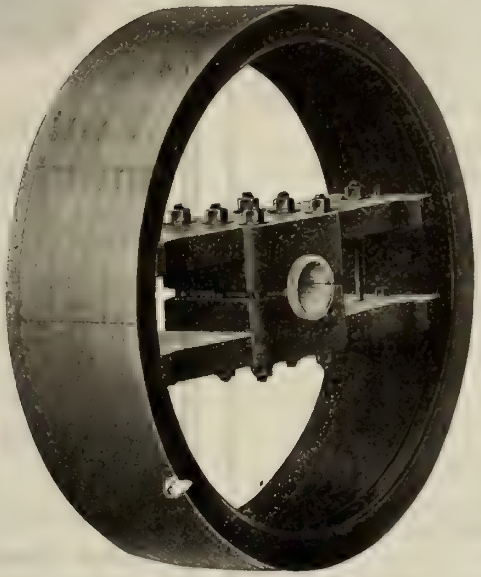
PULLEYS



No Keys

No Set Screws

In Perfect Balance

Lighter

Stronger

Better Belt Surface

The Dodge Standard Wood Split Pulley

The Wood Split Pulley is better than either cast iron split pulleys or steel split pulleys for the following reasons—

The wood pulley is lighter, stronger, better balanced, and provides a very much better belt surface. It costs 33 1-3% less money and provides 50% more returns in horse-power value. It may be run at very much higher speeds with no danger of bursting—also it may be had quicker and in a greater range of sizes.

It costs less to get—less to put on—and less to keep.

We make approximately 300 Dodge pulleys every day—everybody uses them.

There are more Dodge pulleys making ammunition than any other kind—you can get them quick.

Every pulley is thoroughly nailed. Every pulley is guaranteed for Double Belts.

We are Canada's greatest pulley makers.

If you have not our Books, write us.

DODGE MANUFACTURING COMPANY

Toronto - - Montreal

Aside from the *service* they give—you can get them so *quickly.*

WE have always made it a point to render a two-fold service with American Pulleys—first, a country-wide dealer distribution that always makes it easy to get any standard American Steel Split Pulley you want; and secondly, a pulley so good that it will give greater dollar for dollar value than any other pulley on the market.

The 20-year service record of American Pulleys is proof of the pulley service they give — an organization of over 200 dealers located at strategic points throughout the United States and Canada and backed up by 5 warehouses of our own, containing over 60,000 pulleys. This is the service we render pulley buyers in order to give them quick deliveries at any time.

AMERICAN
STEEL SPLIT PULLEY

"FULFLO"
MACHINE TOOL Lubricant PUMP

You can drive your machines faster

but your cutting tools won't stand it — the speed burns them up.

A cutting tool will stand up to higher speed and heavier feeds, providing it is kept cool.

The "FULFLO" Machine Tool Lubricant Pump supplies a good "HEAVY" stream of compound sufficient to carry away all the heat.

No gears or other close-fitting parts to be affected by the grit, dirt, or small chips that are always present in the coolant. No clogging.

The only working part is the impellor. Since no check valve, reverse valve or any other kind of valve is present in the pump or pipe, other than the stop cock, the usual valve troubles are eliminated.

Easily attached to any machine. **Insist that the new machines you buy be equipped with the "FULFLO."**

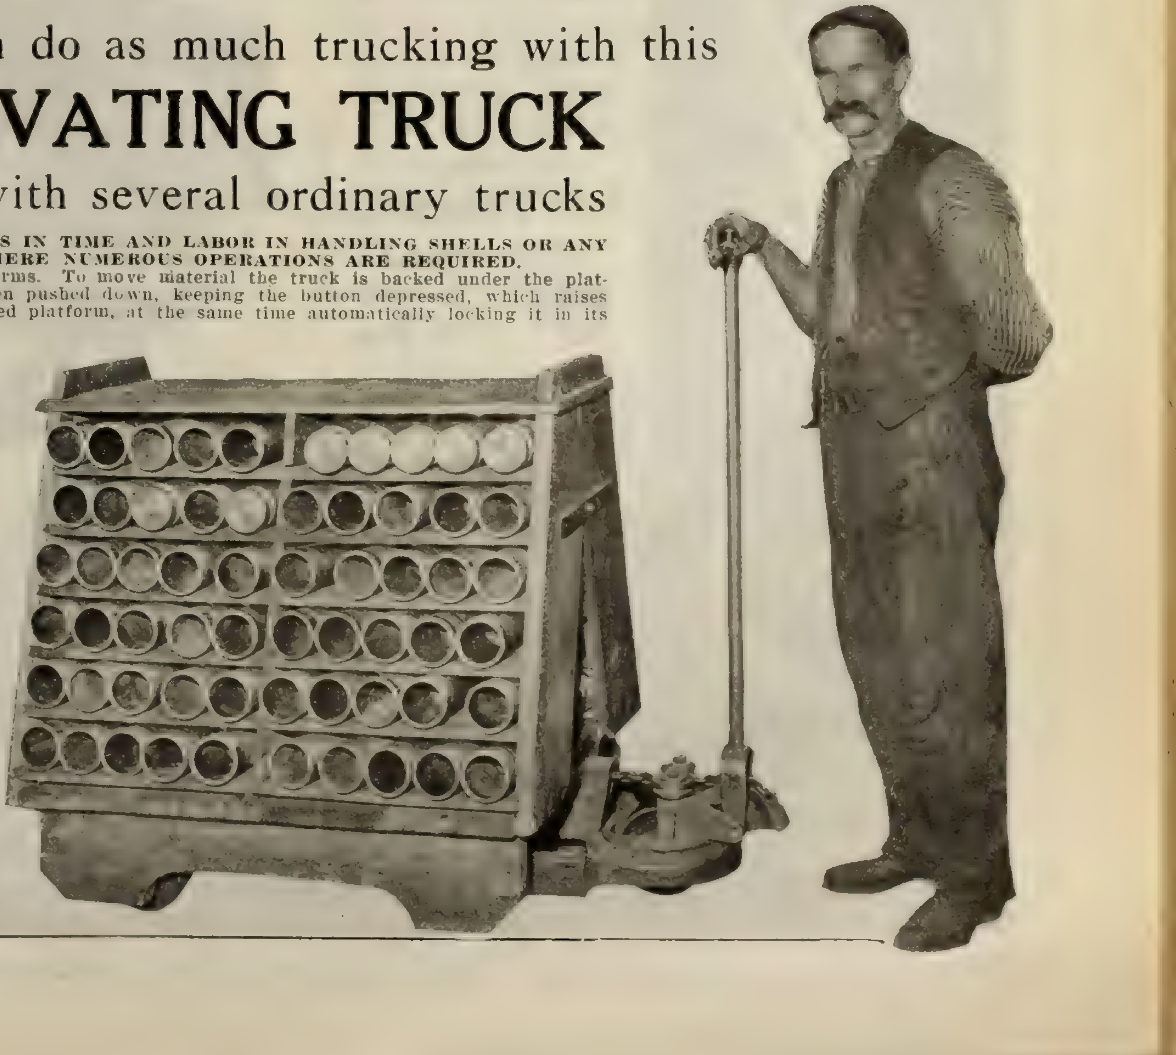
ONE MAN can do as much trucking with this

ELEVATING TRUCK

as several men with several ordinary trucks



IT EFFECTS ENORMOUS SAVINGS IN TIME AND LABOR IN HANDLING SHELLS OR ANY OTHER FACTORY PRODUCT WHERE NUMEROUS OPERATIONS ARE REQUIRED.

All material is stacked on the platforms. To move material the truck is backed under the platform; the handle of the truck is then pushed down, keeping the button depressed, which raises the truck bed and with it the loaded platform, at the same time automatically locking it in its raised position. When hauled to the desired position the button is pressed and the handle is raised, lowering the platform to the floor. The truck is then drawn from underneath and is ready to move another platform. **Raising and lowering of the Truck can be operated with one hand only.**

Can be raised or lowered at any angle.

We also manufacture **Loading Funnels, Ball-Bearing Tightening Nuts, Belt-Driven Loading Vibrators, Bench Vises and Presses, with attachments for pressing in band**—fixtures especially adapted for the manufacture of 18-pr. **Shrapnel Shells.**

We shall be pleased to submit prices and give any particulars required.

Factors Contributing to Maintenance of Press Work Efficiency

Staff Article

The attainment of maximum efficiency, in any line of manufacturing effort, can only be accomplished through the systematic study of operative and constructional details, resulting in the elimination of undesirable features and replacing them with methods and appliances adapted in detail to the particular case, but which in principle can be applied to any given case. Factors controlling the adaptabiliy of tools to a number of different machines are treated from the standpoint of actual shop conditions in the following article.

WITHOUT going deeply into the details of die construction, there are a few features in connection with the general design of sheet metal tools that are often overlooked when the tool-maker starts to work upon the die. While the operation of many press tools requires machines of special design and lift of ram, it is only those of ordinary make and lift that are here referred to. In press rooms where a large variety of work is handled, it is often necessary to use a certain tool in a number of different presses, owing to the one previously used being occupied on another operation. Under these conditions it is essential that the various tools be placed in the different presses, with the minimum amount of ram and bolster plate adjustment.

Height of Punch and Die.

With few exceptions work corresponding in character is performed in the same or similar presses, and for this reason it is advisable that the die can be used in any of the presses. To do this satisfactorily, the height (h) Fig. 1, when the crank is at its lower extremity, should be greater than the height (h) Fig. 2, contained between the top of the punch and the lower surface of the die, when these are in a finished position. Therefore, one of the chief factors to be taken into account when designing a punch press die, is due consideration in regard to this overall height; otherwise it may be found from the base of the die, or the top of the punch, after the tool is completed; often destroying the stability of the die, and consequently its efficiency. Sometimes it is found that after being in operation for some time, a die will not go in a certain press, owing to insufficient ram adjustment, even when the pitman is screwed to its shortest possible length. To operate the tool in this particular press, metal is removed as above stated, and unless great care is exercised in doing this, the accuracy of the die may be destroyed. For example, if stock is cut from the upper surface of the punch block, a condition as shown at B, Fig. 10 may result; where the recut face is not square with the punch shank, and consequently does not bear firmly against the face of the ram.

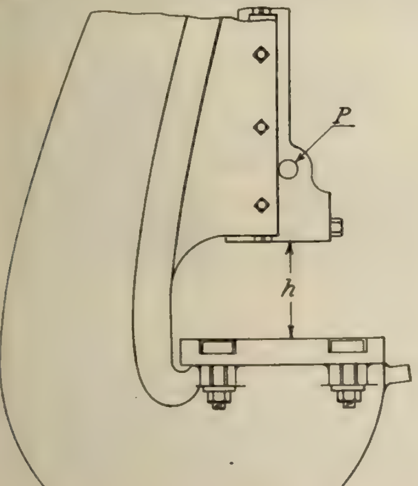

FIG. 1.

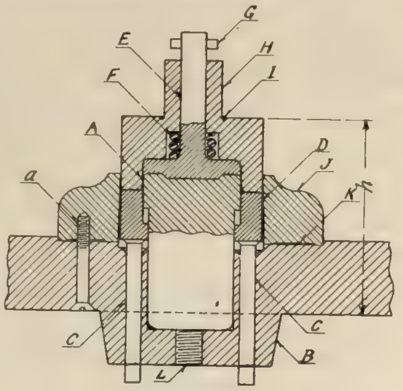

FIG. 2.

Location of Clamping Holes

Next to the consideration of uniform height of dies (as far as possible), for the rapid setting of press tools, is the maintenance of standard dimensions for the relative position of the clamping holes in the various tools used on the different presses.

Wherever possible, all bolsters and die beds (especially the latter), should be made from standard patterns and in as few sizes as the nature of the work will permit; the upper portion of the die being constructed to suit the work required. Frequently when a pattern for a die bed has been constructed, and after the various sections have been placed in position to suit the operation, lugs have been added for clamping, without consideration to distance of location with the result that the position of the holes for the clamping bolts will often come close up to a shoulder, or on the very edge of the casting. Upon placing this same die in one of the other presses, it may be necessary to either drill new holes or extend those already drilled, so that the bolts will enter. In many cases this is due to the die setter failing to re-adjust the bolster plate to conform with the new die. However the chief cause of this objectionable feature is generally a lack of system in locating clamping holes.

It is true that occasions will arise when set rules cannot be strictly adhered to, but, under ordinary conditions, the clamping holes in the die should be on the same centre-line as the punch shank, as indicated in Fig. 3; and where four holes are used they should be

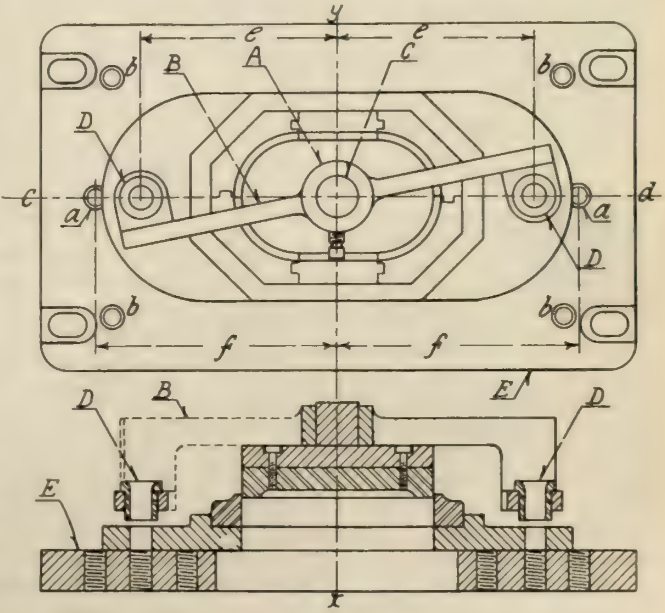

FIG. 3.

located as shown at b,b,b,b; or if preferred, on the two centre lines cd and xy.

Using a Clamping Jig.

For the convenience of locating these holes in the dies, and maintaining a high degree of accuracy, a jig similar to that shown in Fig. 3 will prove very serviceable. This device is applicable to the various sizes and styles of die beds, one being required for each of the several sizes. As the distance l on either side of the punch shank is equal, it is obvious that the die can be reversed and still retain its relative position. By using a short piece of round stock in the ram, the jig can be adapted for laying off the corresponding holes in the bolster plate this latter being located in a central position. Where frequent changes of dies are necessary, this systematic method of locating holes will be found of inestimable value.

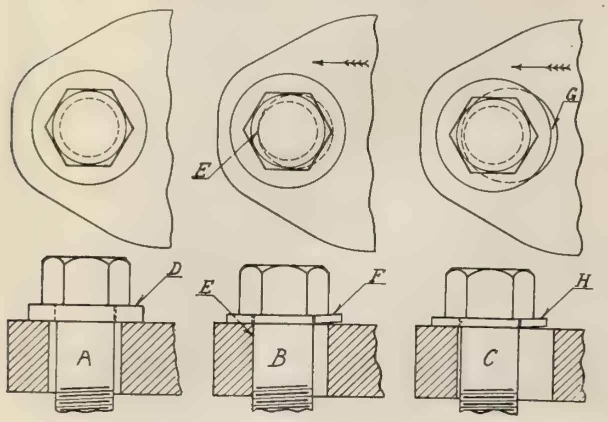

FIG. 4.

Clamping in Position

The efficiency and life of a die depends largely on the care that is given to the holding facilities. In addition to bolting the die firmly to the bolster, it is essential that every precaution be taken to guard against the possible creeping of the die, with the continual jar of the working. To avoid time and expense, of the penny wise and pound foolish sort, some tool makers allow dies to go to the press room that have not been machined on the upper surface of the clamping portion. Under no conditions can it be expected that the rough surface will be parallel to that resting on the bolster plate, therefore it is reasonable to expect that there is the tendency, be it ever so small, of the die creeping from its initial position.

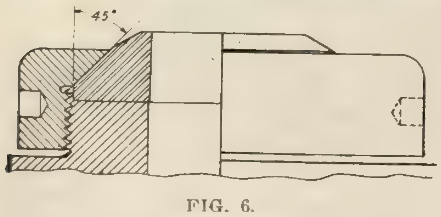

FIG. 6.

When washers are used beneath the head of the bolt, they should be of substantial thickness, as shown at D, Fig. 4, and the nearer the bolt is to the centre of the hole, the better will be the results. If, as shown at B, Fig. 4, the bolt comes in such a position that it bears against the side of the hole, as at E, the pounding of the punch may cause the die to shift in the direction indicated by the arrow. This action would be increased by the use of too small, or too thin a washer, as the clamping pressure at F must be less than that on the opposite side. When this condition takes place, it is common practice in some shops to drill the hole out larger, as shown at C, and while the bolt is freed from direct contact with the side of the hole, the possibility of the die shifting has not been materially reduced, unless a much larger and thicker washer is used.

Use Heavy Clamps

It is often required to secure a die by means of a clamp, instead of a bolt passing directly through the body of the die.

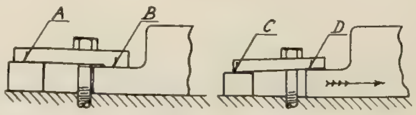

FIG. 5.

In such cases, the clamp should be heavy enough to withstand the pressure without bending, and should be placed in a horizontal position, as shown to the left of Fig. 5; the block A being the proper thickness for the desired purpose. The bolt should be close to the work, but not touch it, and the bearing at B should be wide, and parallel with the lower surface of the die. A condition as shown at the right should always be avoided, as the tendency of the die to creep in the direction of the arrow must be very obvious.

Die Construction

The design of a die would naturally be that best adapted for its particular purpose, but in order to briefly describe the component parts of the ordinary blanking and drawing die, and also the plain blanking die, the sketches Figs. 2 and 6 are shown. To provide a long bearing for the center post A, the die has a boss B on the base; this portion also furnished ample support for the push pins C, C, which are sometimes subjected to considerable compression owing to the action of the rubber that supplies the pressure required for the drawing operation. The draw ring D rests upon the push pins C, and should be thick enough to stand the strain of the draw without bending. If this ring is too weak, or the number of push pins is insufficient, the additional pressure directly over the pins may cause "lugs" to form on the finished product. The retaining shoulder on the inner diameter of the ring should allow the upper or draw surface to come just above the cutting edge of the die. The top of the post A should be slightly below the cutting edge of the die, as this permits the flat stock to be held firmly between the punch and the draw ring while being cut, the drawing operation being performed as the punch proceeds downwards. The knockout E, which also forms the upper impression in the sheet metal cap, ejects the latter on the upward stroke, by means of the spring F, the pin G preventing the knockout from coming out of its position. To insure a good bearing of the punch H upon the face of the ram, it is a good plan to cut a small groove at the base of the shank, as shown at I.

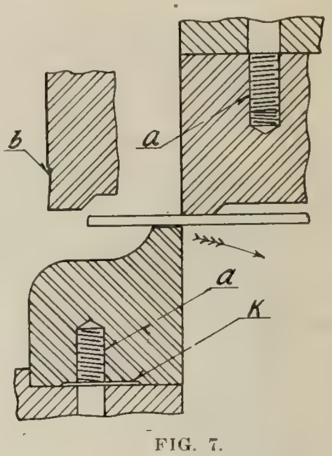

FIG. 7.

When turning the cutting ring J, it is advisable to cut a shallow recess in the base, to reduce the grinding necessary, and also add to the holding qualities.

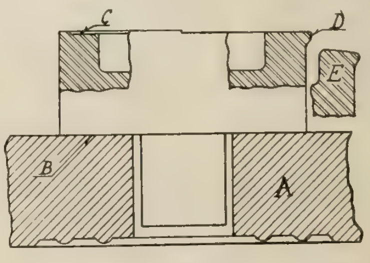

FIG. 8.

The steel ring should be hardened and ground before the cast iron bed is checked to receive it, as the shrinkage due to hardening, and subsequent grinding would mean a loose fit, if the parts were fitted earlier.

Holding Circular Dies

In the construction of some circular

cutting dies, it is common practice to hold the cutting ring to its seat by means of a nut, fitted to a threaded portion of the die bed below the steel die, as shown in Fig. 6; the clamping portion being machined at an angle of 45 degrees, the most suitable angle for the purpose. By this method it is possible to remove the cutting ring for regrinding without removing the die from the press.

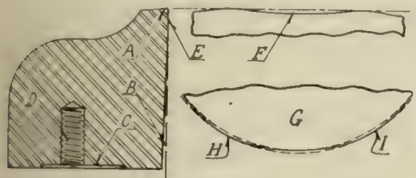

FIG. 9.

When securing the steels of sectional dies in position it is important that the bearing on the base should be perfectly flat, to avoid any possibility of rocking motion, which is often more pronounced in this type of die. In addition to having a good firm bearing it is also frequently advisable to locate the clamping screws (a) (a) Fig. 7 a little more than half the distance back from the cutting edge. When the pressure required to cut the stock comes upon the die, there is a tendency for the cutting edge to move inwards, as shown by the arrow, therefore the leverage from the cutting edge to the clamping screw should be as great as circumstances will permit. An exaggerated condition of the punch after a series of blanks have been cut is shown at (b) and will demonstrate the action of the die, when in operation.

Upsetting and Repairing Dies

A feature of press work that requires careful attention is the repairs which are necessary to maintain the tools in good working condition. Individual cases must be treated according to their own particular needs, and the repair man will require to use his best judgment, as each occasion may demand. A few of the elementary factors are here cited. Probably the most common call on the tool room is the refitting of a worn die. Where soft punches are used it is customary to upset and re-turn them. To do this satisfactorily, a solid block should be provided, with a hole in the centre large enough to receive the punch shank freely as shown in Fig. 8. A large worn out die is often most useful for this purpose, one that will give a good solid bearing to the back of the punch block. Before upsetting the punch, it is advisable to cut a shallow recess in the face as shown at C, Fig. 8. This permits the upsetting to be accomplished more easily, the result being as shown at D. If the face is not first cut away the shape, after upsetting, would be similar to that at E.

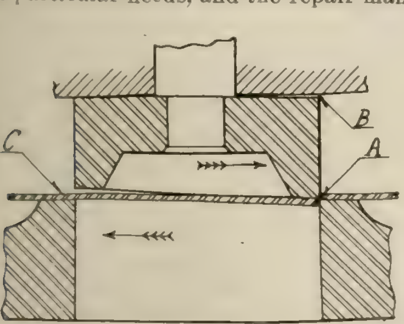

FIG. 10.

Grinding the Shear

In grinding and regrinding the shear on the face of cutting dies, the general practice is to allow about the thickness of stock, as indicated at F, Fig. 9. In addition to the shear, a slight rake, as at A is also given. If the clearance B is excessive, and extends right up to the cutting edge, any undue shear would result in an uneven blank as shown at G; the inner dotted circle representing that cut by the high points, and the outer dotted circle that cut by the bottom of the shear, the heavy line being the true outline of the blank. To offset this, a portion of the inner surface at E is ground to give very little clearance.

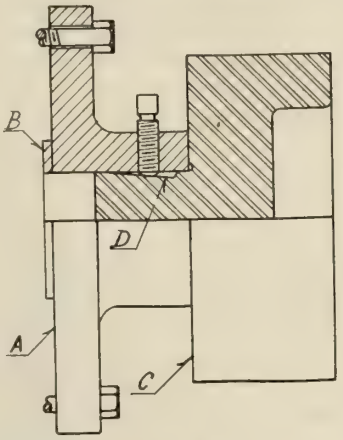

FIG. 11.

Unnecessary repairs are often occasioned by a condition similar to that shown in Fig. 10, where one side of a die is in action in advance of the opposite side. This causes the punch and die to be forced in the direction of the arrows, and this action is more pronounced as the cutting edges, become dull, the punch will gradually be sheared at the point A.

Turning Punches.

When turning a punch to fit the die, it is usually held in a chuck that is secured to the face plate of the lathe as shown in Fig. 11. Where the chuck is exclusively used for central work, some tool makers prefer to have a shallow boss B on the back that fits into a recess cut in the face plate. Before starting work on the punch, care should be taken that the face C runs perfectly true, to insure accurate alignment when placed in the press. This may be aided by filing a tapered portion D on the shank, so that the pressure of the screw will drain the punch firmly against the face of the chuck.

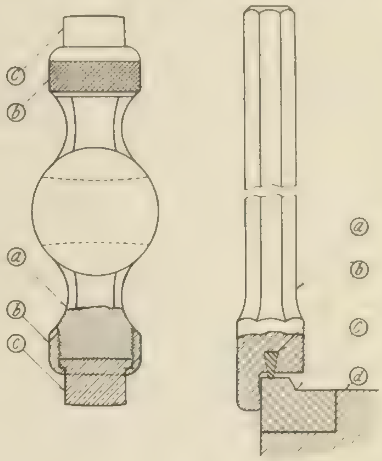

FIG. 12.

For the repairing of dies, two very useful tools are shown in Fig. 12; that on the left being a special soft headed hammer for use on finished parts. The pieces (c) can be made of leather or any kind of soft metal and held in position by the nut (b). The tool to the right is used for upsetting punches without striking the cutting edge. By making the shank (a) extra long punches can be upset while in the press.

MORE CANADIAN MUNITION ORDERS

MUNITION orders placed in Canada since the outbreak of the war amount to $550,000,000. An order for munitions to the value of $60,000,000 has just been received and contracts to that amount are to be placed. Since the first of the year orders have been placed amounting in value to $185,000,000.

These figures were made public on Oct. 11 by the Imperial Munitions Board. During the months of July and August the output from Canadian industries was interrupted by reason of the difficulty experienced in procuring the necessary steel and forgings. The board is now pleased to state that, due to the efforts put forth by manufacturers, the output on most contracts is more satisfactory and increasing in volume each week.

The quantity of shrapnel shells now produced each week, complete with cartridge cases, fuses, primers and propellant charge, has reached almost 250,000, and the board has been authorized within the past week to place continuation orders for this size of shell into 1917. Large orders were placed during last spring and summer on the larger sizes of shells, especially 8 in. and 9.2 in. This involved complete new installation of machinery and equipment. Many of these plants have now commenced operating, and the output of larger-sized shells is increasing each week, and will continue to increase until about January 1st, when the maximum output of the plants should be reached. The position in Canada in regard to steel, the basis of all munition work, is now such that no interruptions in output will likely take place, as the immense tonnage required for all classes of shells has been arranged well ahead. The fuse plant built by the board in placing new business will be to keep all plants now producing munitions fully employed, and where increased production is required on any particular class of work to extend the operations of plants which are already equipped and producing.

BIG INCREASE IN DOMINION REVENUES

HEAVY increases in revenue receipts, evidences of the steadily mounting cost of the war and the total of the net debt, together with a slight decrease in domestic expenditures, are reflected in the Dominion financial statement issued recently. This statement gives the figures for the month of September and for the first half of the current fiscal year.

During the six months revenues have increased by over thirty millions as compared with the corresponding period of last year. Expenditures on consolidated account have increased by three and a half millions, while those on capital account have decreased by five and a half millions. During the six months Canada spent sixty millions more for war than she did during the corresponding period last year, while her expenditure for the month of September is just double what it was in September, 1915. At present the war is costing the Dominion just about a million a day. Since September, 1915, the net debt has been increased by nearly $200,000,000. At the end of last month it stood at $680,275,444, as against $484,841,633 on September 31, 1915. The increase in the debt for the month alone was over twenty millions as compared with August.

Nation's Revenue

The total revenue for the six months is $103,589,680, an increase of $30,346,166 over the corresponding period last year. Customs receipts are responsible for twenty millions of the increase. Excise for two million; post office for $800,000; railway receipts for five millions, and miscellaneous for over a million.

For the month of September revenue receipts increased by six and a quarter millions as compared with September, 1915. Customs are responsible for three and a half millions of this increase, excise for half a million; post offices for $450,000, and railway receipts for three-quarters of a million. On consolidated fund account (ordinary expenditure) there was spent during the six months $49,757,711, as against $46,271,622 for the corresponding period last year, or an increase of three and a half millions. This increase is nearly all accounted for during the month of September, and may be due to extra interest charges on the debt.

Over Two Millions Saved

On capital account (public works, etc.) a total of eleven millions was spent during the six months, as against sixteen and three-quarter millions for the corresponding period last year, or a saving of five and three-quarter millions. The net saving on domestic expenditure, during the six months, has, therefore, been about two and a quarter millions. During the six months, $104,538,895 was spent on war, as against only $44,427,893 for the corresponding period of 1915, or an increase of $60,111,002. For the month of September alone, a total of $28,228,176 was spent on war, which is fourteen millions more, or just double what was spent in September, 1915.

Figures showing the funded debt of the Dominion indicate the changed character of Canada's financing superinduced by the war. Of this funded debt over $75,000,000 is payable in New York. On September 30, 1915, Canada had nothing payable in New York. On Sept. 30, 1915, Canada had only $757,960 of a funded debt payable in the Dominion. To-day she has a total of $118,645,070. Her funded debt payable in London totals to-day 470 millions, as against 362 millions in September, 1915.

SHIPBUILDING ON PACIFIC COAST

FROM Prince Rupert on the north to San Diego on the south come reports of shipbuilding activity, and the hum of industry is heard in all the shipbuilding yards of the Pacific Coast, where, it has been estimated, that steel and wooden ships are under contract or construction of a value of $75,000,000. There is every reason to believe that this encouraging condition will continue for a long time to come.

In the Pacific North-west, steel and wooden ships are being constructed, for contracts are in hand for their construction, reaching a total cost of $30,000,000. This estimate includes the work reported from yards in British Columbia, Puget Sound, Grays Harbor and the Columbia River, and is certainly a splendid showing for the shipbuilding of the Pacific North-west as well as foreshadowing a healthy and most encouraging revival in this most important industry. The preponderance of the tonnage being built is foreign, Norway leading with most of the steel steamships, although two of this class are being built for the Atlantic coastwise trade. The wooden ships are mostly for American owners, although the Government of British Columbia by offering a subsidy is greatly stimulating the industry so that it is forging ahead and may soon take the lead for this class of ships.

RATES TO BE PAID CANADIAN SEAMEN

AN Order-in-Council has been passed providing regulations for the enlistment of men "in the Royal Naval Canadian Volunteer Reserve" for overseas service in the Royal Navy. The men enlisting will be enrolled for the period of the war. Ordinary and able seamen will receive $1.10 per day; leading seamen, $1.20; petty officers, $1.40, and the chief petty officers, $1.90.

Men subsequently transferred to stoker ratings will be paid 10 cents per diem more than the pay of their equivalent seamen ratings. Wives and approved dependents of men enrolling will be paid from the date of enrollment separation allowance on the following scale: Wives and approved dependents of ordinary seamen, able seamen, leading seamen and equivalent ratings, $20 a month; petty officers and chief petty officers and equivalent ratings, $25 per month.

B. C. SHIPYARDS BUSY

WORK in the British Columbia shipyards is going ahead at full speed. At the Victoria plant of the Cameron-Genoa Mills Shipbuilders, the operation of lining up the third keel for the schooner to be known as the Esquimalt has been completed. Each of the vessels will cost when completed about $130,000, so it is estimated, but from one cause and another the actual cost will likely be in the neighborhood of $150,000. They measure over all 225 feet, with a beam of 42 feet. Each will have a hold of 19 feet, will be schooner rigged with five masts, together with modern equipment for handling loads. The auxiliary power equipment will consist of oil-burning engines of the Bolinder type, which are being imported from Sweden. Three sets are already delivered, and it is expected that more will be on hand in time for the completion of other vessels on schedule time.

The Cameron-Genoa Mills Shipbuilders, Ltd., has to date invested about $50,000 in new plant and material. The Wallace Shipyards, Ltd., who are also building several ships of the above type, have invested about $35,000 in their enterprise.

PRODUCTION METHODS AND DEVICES

A Department for the Interchange and Distribution of Shop and Office Data and Ideas Evolved from Actual Practical Application and Experience

METHODS OF MEASUREMENT FOR EXPERT MECHANICS

By F. Scriber.

WITHOUT method a goodly tool may be a poor makeshift—is sound logic for a tool-maker or inspector when taking measurements to insure accuracy. It takes good machines to do good work and it takes good tools to know when the work is correct, but it takes sound reasoning to be sure one is not getting fooled in the measurements as taken. A tool-maker should plan his work and set up his machine with an eye to accuracy first and last, always allowing production to be the effect of interchangeable accuracy, and never permitting speed to induce a questionable set-up.

Principal Aids to Accuracy

The measuring methods here illustrated are reviews of set-ups which it is hoped will be suggestive and are the kind of examples which conduce toward certainty in the finished product, the three tools shown in Fig. 1 being three of the big aids used to attain this end, and are, namely, Vernier Caliper, Vernier Height Gauge and Surface Gauge.

It is not always advisable to take measurements on a piece of work in the same manner as the dimensions are given on the drawing, and, in fact, unless the drafting department is in the habit of considering how a piece will be meassured it is often desirable to deviate to some extent in actual practice. In Fig. 2, at the top is shown a fixture with all dimension reading from the bottom of the fixture, and this is to the hole, all other important dimensions being given from this hole down. As the actual distance from the bottom of fixture to the holes and finished seats is not important, but rather the relation of the holes and seats to each other, the better way of dimensioning is as shown in the lower view. In either case the fixture may be set upon a surface plate and measurements taken from one seat to another or to a plug in the hole.

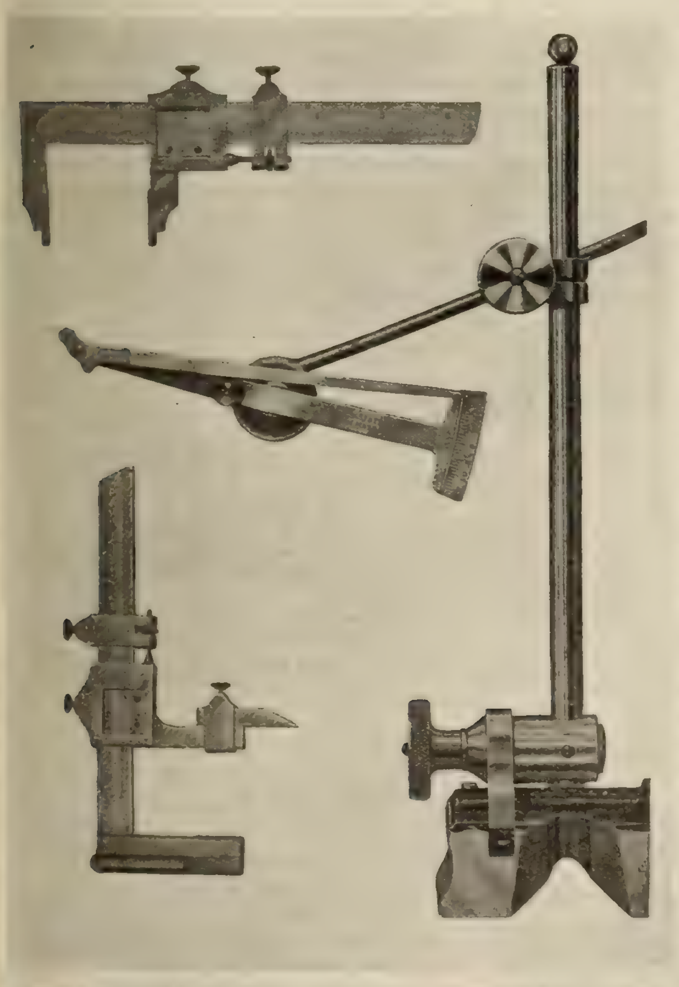

FIG. 1. THREE OF THE PRINCIPAL INSTRUMENTS USED IN MEASURING DIMENSIONS OF MACHINE WORK.

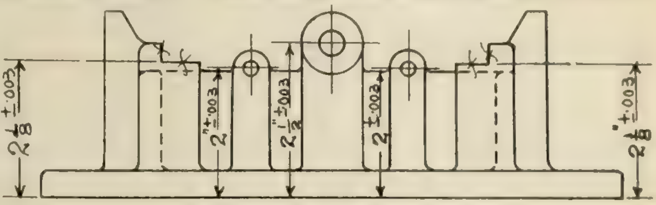
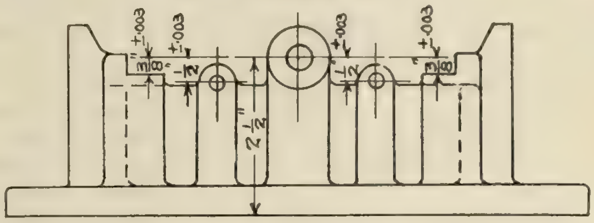


FIXTURE WITH DIMENSIONS GIVEN FROM BOTTOM

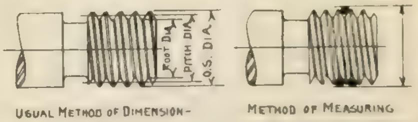


A MORE SATISFACTORY WAY OF DIMENSIONING THE ABOVE FIXTURE.

FIG. 2. TWO METHODS OF GIVING DIMENSIONS ON DRAWINGS.

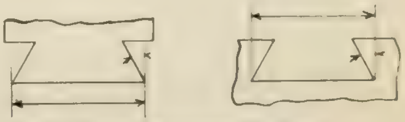
Overlapping of Limits

A glance at the limits given on the dimensions in these two views brings up a very interesting point which might easily be overlooked. It will be noticed that the limits in both cases are plus or minus .003 in., but where the dimensions are given as in the lower view, this means just what it says, plus or minus .003 in., while if the dimensions are measured as given in the view at top of illustration, the limit of accuracy allowed is actually .006 in., as in measuring to one place the reading might be 2½+.003 or 2.503 in., while in measuring to the other surface the reading might be 2⅛—.003 or 2.122 in.; therefore, 2.503—2.122=.381 in. as compared to 2½—2⅛=.375 in., and subtracting one from the other .381—.375=.006 in. Thus, it follows that dimensions given as shown in the upper view must be held to one-half the limit allowed on dimensions

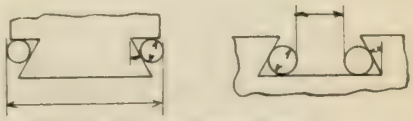


USUAL METHOD OF DIMENSIONING THREAD

METHOD OF MEASURING THREAD BY WIRE SYSTEM



COMMON METHOD OF DIMENSIONING DOVETAILS



MEASURING DOVETAILS BY THE USE OF PLUGS

FIG. 3. TWO APPLICATIONS OF COMMON PLUG OR WIRE MEASUREMENTS.

as given in the lower view to obtain the same relative accuracy, and, incidental, the closer the limit the longer the time required for doing the work, and thus it will be noted there is a distinct advantage in giving dimensions as shown in the lower view.

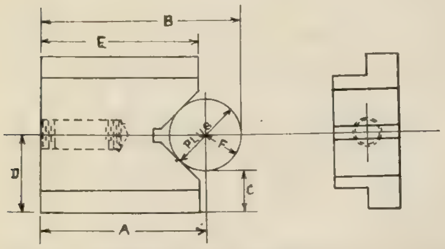


FIG. 4. METHOD OF MEASURING A VEE BLOCK, USING A PLUG FOR ACCURACY.

Calipering over plugs, buttons, wires and balls is the ideal way of measuring a great many classes of work which have angular surfaces. In this class are included the wire system of measuring screw threads on the pitch line and the measurement of dovetail slides, both of these methods being shown by Fig. 3, where the ordinary methods of giving dimensions for these parts are shown, and also the method of calipering with plugs or wires.

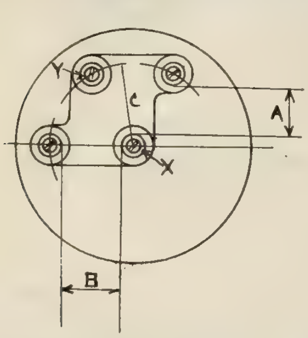

FIG. 5. LOCATING HOLES BY THE BUTTON METHOD.

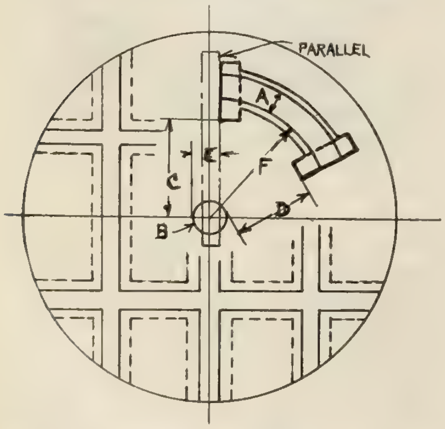

FIG. 6. METHOD OF LOCATING WORK RADIALLY FOR MACHINING ON BORING MILL.

Plugs and Trigonometry

It is sometimes difficult for a beginner to take measurements by the plug system unless the work is dimensioned in that manner, inasmuch as a knowledge of trigonometry is necessary to change a dimension given across points, to a dimension suitable for plug measuring, but the extra work is well worth the trouble when the resultant accuracy is desired, or when the parts can not be fitted, and reference to the principles involved for these calculations can be had by consulting any up-to-date machinist handbook.

The dimensions necessary for accurately measuring a vee are shown by Fig. 4, where a plug is used, as it is impossible to measure accurately to sharp corners with a scale. In this case the plug is equal to the size of work which rests in the vee; A is the distance from seat which vee rests against to centre of work; B is this distance plus half the diameter of the plug, and the other dimension C is obtained in the same manner by subtracting F from D, while E is the length of block.

Laying out holes by the use of buttons is illustrated by Fig. 5, and the manner of accomplishing this is obvious, as all holes are measured in a horizontal or vertical plane A and B from a central hole, while the radius of the buttons X and Y must be subtracted from the dimension C for measuring between the buttons, this method being preferable to radial and angular measurements for accurate work.

Fig. 6 illustrates an example in setting up a boring mill for cutting the slot A after the other portions were finished, using a plug B in the centre of the face plate and calipering at C, D and E to locate the work while the radius is measured across F, it being necessary when locating the work to hold a parallel bar, as shown by the dot and dash lines to permit of calipering at right angles to the various surfaces over to the plug.

Progressive Height Measurement

A micrometer depth gauge clamped to a straight edge for use in measuring depths where the opening across top of hole is too wide to support the beam of the depth gauge is shown by Fig. 7, while a height gauge of the vernier type, as shown in Fig. 1, can frequently be used to good advantage for measuring such work as is illustrated at the left of Fig. 8. On this piece of work it is desired to measure the thickness of each projection X, and this is accomplished by squaring up the work in the vise A in right-hand view, when, by setting the vise on a surface plate B, the distance C is measured, which is followed by measuring the distance D, and likewise all of the other distances from surface plate, when by deducting one from the other the thickness of each projection is obtained. Care should be taken not to disturb the part in the vise until all the desired measurements are made to obtain correct readings in rotation.

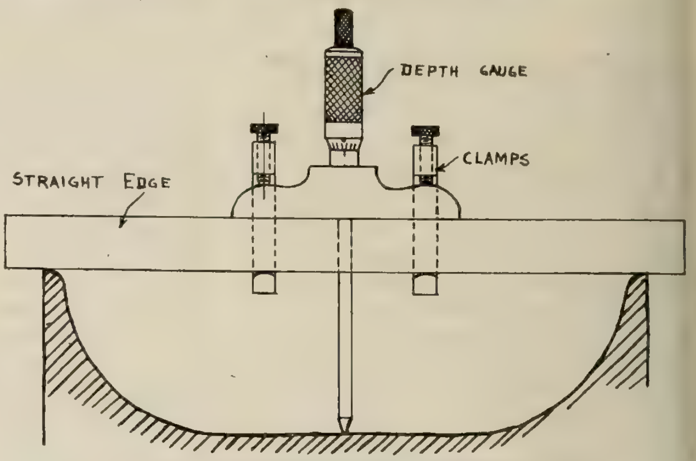

FIG. 7. EXAMPLE OF MEASURING DEPTHS HAVING A WIDE OPENING.

Suitable calipers not being available with which to measure the pulley shown in Fig. 9, the diameter was computed by use of the set-up shown. This consisted of placing the work on a milling machine table held between two angle irons A, with an arbor B in the hole of the pulley, when by measuring across C, multiplying this by two and adding the diameter of the arbor, the size of pulley is accurately obtained.

As an incidental feature of measuring, accuracy is often the result of keeping close watch of the method of setting up the work when machining, for, as any first-class mechanic knows, it is

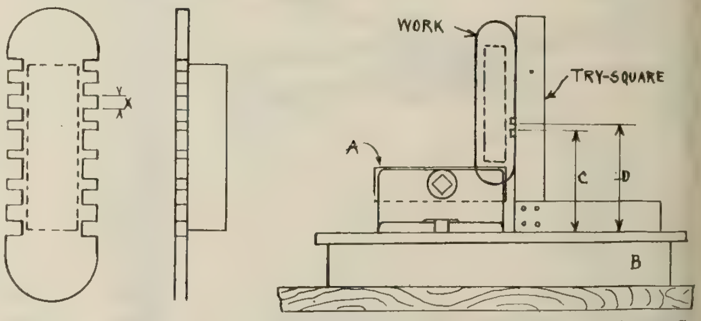

FIG. 8. LEFT: WORK TO BE MEASURED. RIGHT: SHOWING USE OF TRY SQUARE AND HEIGHT GAUGE FOR MEASURING WORK.

harder to plane or mill a piece square by machining the sides haphazard than by keeping the end of the work always at the same hand of the operator and locating in succession against the side last machined. For this reason when machining work which is to be square it is advisable to have a point contact for pinching the rough side of the work similar in principle to that shown by Fig. 10, which shows the four cuts in the order made, as indicated by the finish marks and a piece of round stock between the sliding vise jaw and the work. This principle of squaring from the proper surfaces should be borne in mind when locating all classes of work for machining or measuring.

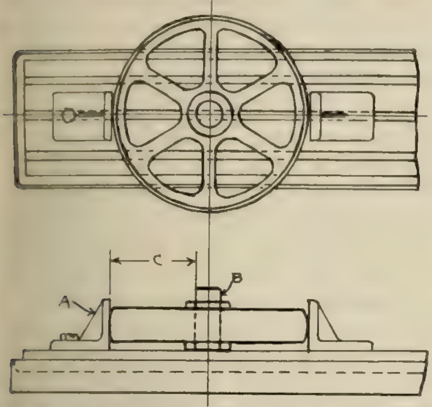

FIG. 9. A METHOD USED FOR MEASURING A LARGE PULLEY.

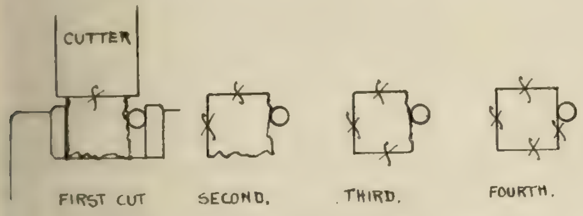

FIG. 10. ILLUSTRATION OF PRINCIPLE INVOLVED IN MACHINING WORK SQUARE.

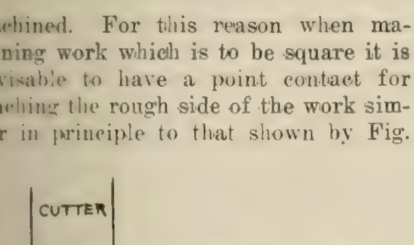
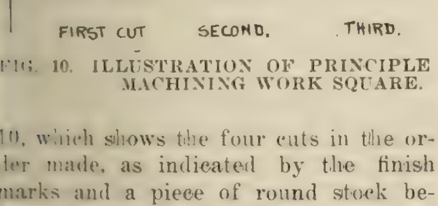


DISC WHICH IS COUNTERBORED



METHOD OF DIMENSIONING DISC

FIG. 11. TWO VIEWS OF WORK WHICH IS SET UP AS SHOWN IN FIG. 12.

Milling cutters are often located in relation to the work by means of set blocks, but the mere fact that set blocks are provided for this purpose is no guarantee that the work produced from a set block measurement will be accurate, and the work produced should, therefore, be measured to be sure it is correct. Reasons for this are obvious, as a milling cutter out of truth will not cut correctly, and likewise when setting straddle milling cutters on the arbor, allowance must be made for ''tightening the nut'' when the cutters are located by means of a set block, as the tightening of the nut forces the cutters closer together and makes them cut small, thus 1.000 in. test with set block may be .995 in. on the part machined.

The Use of Construction Holes

Several examples in the use of construction holes to facilitate the measurement of angles are shown by the following sketches, this often being the most convenient way to obtain an accurate angular measurement. Fig. 11, upper view, shows a round disc with two counterbored cuts A and B in it. The difficulty of measuring these counterbored cuts is at once apparent, but by putting in a construction hole A, lower view, Fig. 11, with a pin in it, the work may be set up, as shown in Fig. 12, and counterbored. The measurements may be taken as given at B and C, Figs. 11 and 12, using a height gauge to get the difference in height from the table of machine, and as the construction pin is located from face of disc D the work will be correct. The dimensions for locating the other counterbore are E and F, Fig. 11, while the angles are G and H. To locate the work at the proper angle for counterboring, a plug J may be used, which is set to the dimensions K and L, which are figured by trigonometry to give the desired angle, as will be explained later. It will be noted on this example that the dimensions are given to centres, although in actual practice the radius of the construction pins must be subtracted from the centre distance, and the measurements taken between the pins or buttons.

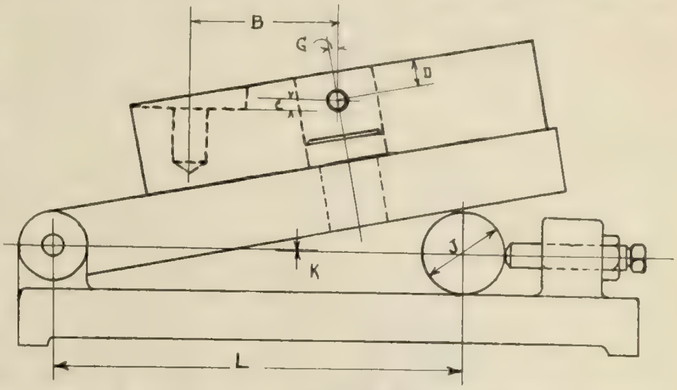


FIG. 12. METHOD OF SETTING UP THE WORK SHOWN IN FIG. 11.

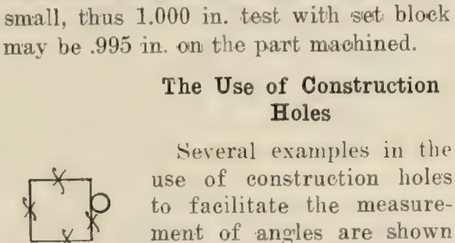

FIG. 13. EXAMPLE OF MEASURING ANGULAR SURFACE AND LOCATING PIN "A."

Illustration Fig. 13 shows an accurate method of locating the pin A from the seat B, and also shows the method of measuring the seat B from the bottom and the angular surface from the seat by the use of a construction hole, this being a typical milling fixture construction measurement. In this instance the seat B is first machined to dimensions C, D and E, following which the construction hole F is located to the dimensions G and H, from which it is a simple matter to measure the angular surface from the construction hole using angle and dimension J, which likewise the hole for pin A is measured using dimension K and angle.

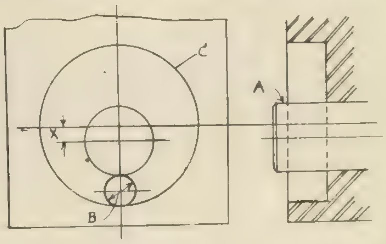

FIG. 14. MEASURING AN ECCENTRIC HOLE WITH PLUG.

Ascertaining Eccentricity

A simple way of measuring an eccentric hole in relation to a concentric hole is illustrated by Fig. 14. In this set-up an arbor A is placed in the small hole and the eccentric hole is calipered to get the exact diameter, when by trying test plugs B between the arbor and the hole the amount of eccentricity can be calculated by adding half the diameter of the arbor A to the plug B and subtracting this from half the diameter of the eccentric hole C, the result equaling X.

MISFITS IN SCREW THREADS

IN a paper on "The Standardization of Screw Threads," presented before the American Railway Master Mechanics' Association, F. O. Wells stated that in searching for the principal reasons of misfits in screw threads it had been found that non-interchangeability was due less to inaccuracy in the screw-cutting tools themselves than to the unreliable methods employed in taking and transferring measurements, and also to the total disregard of proper tolerances for both male and female threads.

In theory, screw-cutting tools should reproduce their own threads; in practice they did not always do so. The principal point to be brought forward was that it was not the tools that had to interchange, but the work done by them. It was generally agreed among tap and die and screw manufacturers that the screw was the basis from which all formulas and calculations should be derived. The usual custom was to tap a hole and fit the screw to the tapped hole, and in the process of making a screw, if the lead of the tap was not normal which had been used to tap the hole, the operator kept cutting down the screw to fit the hole, and consequently got it greatly under size of the tapped hole.

It was a fact that the vast majority of taps broke in use and that very few wore out. Some authorities put the total breakage at 90 per cent. of all the taps used. This breakage was due largely to the fact that the holes to be tapped were not either drilled or reamed to a large enough size. For ordinary work, three-quarter depth of thread was good practice. A nut having only one-half depth of thread would break the bolt before it would strip the threads. The outside diameter had little or nothing to do with the fit for a screw thread as long as the screw was made basic, or smaller, and the tap over basic. If this condition existed, when put into use the metal in the top of such threads flowed and made a fit depending upon the tolerances; the closer the tolerances, the tighter the fit. Pitch diameter and lead were two factors of equal and reciprocal importance.

Tests showed that long, curly chips from taps required less power, and there was consequently less breakage than from taps which made fine, granulated chips. This statement was equally true of dies. To obtain these curly chips it had been found necessary to give these taps and dies a certain amount of positive rake, this rake depending upon the material to be cut. To make the tolerance of screw threads within well-defined limits for railroad work would tend to prevent the nuts and screws from working loose, and no doubt help to decrease the number of accidents that could be prevented by some forethought and care. These limits must be very carefully worked out, because on screw threads subject to jar, if the fit were too loose, the parts would quickly come apart, while if the fit were too tight the strain set up by the tight fit, together with the jar, would soon carry the part beyond its breaking strength, and so cause a rupture.

DON'TS FOR LATHE HANDS.

By R. M.

DON'T have a lot of things lying on the saddle.

DON'T use the saddle of the lathe for an anvil.

DON'T leave the chuck wrench in the chuck—something might happen.

DON'T use metal belt fasteners where belts are to be shifted by hand.

DON'T start a new machine unless you are familiar with the mechanism.

DON'T let your lathe centers go too long without redressing. The proper angle is 60 degrees.

DON'T permit the center lubrication to become full of grit. Keep it clean and under cover.

DON'T be continually using belt dressing to increase the driving power. Look elsewhere for the trouble.

DON'T forget that an occasional drop of oil on the tool post screw will increase the holding power on the tool.

DON'T try to pull cuttings from about the work with the hands while the work is in motion. Use a bar or stick.

DON'T slack off the gib screws unless the slide is too tight. The trouble is often too much dirt and insufficient lubrication.

DON'T have any excess overhang on the cutting tools. The closer the working point is to the center of support, the better the results.

DON'T allow grease and dirt to accumulate on the sides of the cone pulleys. The belt will have a tendency to climb to the next step.

DON'T place a center or drill socket in the lathe spindles unless you are sure they are both free from dirt and other objectionable features.

DON'T put too much oil on the feed screws that are open to the cuttings from the work. Excess of lubrication in this respect may prove as expensive as too little.

DON'T forget that heat will be generated when turning small shafts, causing the work to elongate. The tail stock center may require to be gradually released to avoid distortion in the the shaft.

◆

CANADA'S TRADE FOR PAST YEAR

DETAILED figures of exports and imports for the twelve months ended with last June, as published by the Trade and Commerce Department, shows some interesting developments of trade conditions during the two years of war.

Exports to Britain have nearly trebled while imports from Great Britain hav fallen off by over 25 per cent. For th twelve months ended June last, Canada' exports to Britain totalled $557,909,00 as compared with $209,609,000 for th twelve months ended June, 1914. Imports from Great Britain were $90,275 000, as compared with $121,461,000 tw years ago. Canada's favorable balanc of trade with the mother country for th twelve months ending last June wa $476,647,000.

Trade with the United States show an increase of nearly $74,000,000 in imports and of $117,865,000 in exports during the two years. Imports increase from $363,117,000 in 1914 to $442,088,00 in 1916. Exports increased from $182, 575,000 to $300,440,000. The balance o trade for the twelve months ended wit June last was in favor of the Unite States by $141,648,000.

Canada is now buying $74,000,00 worth of goods a year more from th United States and $31,000,000 worth o goods less from Great Britain than wa the case two years ago.

The rise in the price of foodstuffs meats, etc., is explained to some exten by the fact that Canada found it necessary to import during the twelve month ended with last June, provisions costin $15,561,000, breadstuffs costing $10,938, 000 and vegetables costing $2,549,000, total of $30,000,000 worth, on all o which the consumer had to pay a substantial duty.

The increase in the importation o provisions for the twelve months wa nearly $10,000,000 as compared with th preceding twelve months.

On the other hand, exports of cattle increased from $8,702,000 to $12,505,000 o breadstuffs from $123,851,000 to $304, 388,000 and of provisions from $49,388, 000 to $73,210,000. Exports of cheese fo the twelve months ended with last Jun totalled $27,731,000, a $6,000,000 increase, and of bacon and hams, $31,082, 000 a $14,000,000 increase.

The growth of temperance is probabl reflected in the increased consumption o tea and coffee. For the twelve month ended with June, Canada bought tea t the value of $8,557,000 and coffee to th value of $2,033,000. There are increase of $1,133,000 in tea and $379,000 i coffee as compared with the precedin twelve months.

On the other hand, the importation o spirits and wines decreased from $4, 563,000 in 1915 to $3,992,000 in 1916.

The percentage of duty collected o taxable imports has increased from 2 per cent. in 1914 to 34 per cent. at th present time.

The Development of Irregular Sheet Metal Pipe Connections

Staff Article

The problems dealt with in this article are typical examples encountered in actual practice, which, while not of very frequent occurrence, may be of considerable importance when met with. They possess considerable divergence from ordinary symmetrical forms and a study of the methods employed will enable their application to be successfully carried out in similar cases.

A SHEET metal problem, involving some interesting projections and developments, is illustrated and described in the accompanying article. In Fig. 1 are shown four views of the piece required—(a) front elevation; (b) side elevation from the left; (c) side elevation from the right; and (d) top view. The diameter of the lower vertical section F is to be 2 feet, and also the branch A; the branch B is 18 in. in diameter, the centre line of both branches making an angle of 45 degrees with the centre line xy, and intersecting in a common point, as shown at O.

Drawing the Front Elevation

To draw the several views in Fig. 1, first erect the vertical line xy and the base line ab. From the point 4, mark off the distance 4, 0, equal to 2 feet, and from the point 0 draw the centre lines of the branch pipes at an angle of 45 degrees. At a distance of 4 feet from the base line draw the horizontal line $1\ 1^1$, showing the top of the transition piece D; also a line 6 inches higher upon which the extreme points of the branch sections A and B lie. On either side and parallel to the centre line of each branch draw the lines $1, 1^1$ and $7, 7^1$ at a distance equal to the radii of the pipes. Draw the lines 1, 7 at right angle to the centre lines, and in such a position that the point 1 falls on the extreme top line. Then from the point 4 describe the semicircles into six equal parts, projecting the points parallel to their respective centre lines, and dividing the sections A, B and F as shown. Lay off the line $4^1\ 7^1$ in A so that the two angles (i) and (i) are equal, also the line $1^1\ 7^1$ in F, so that the angles (j) and (j) are equal. This makes the piece C a portion of a round pipe with a diameter equal to that of A and F.

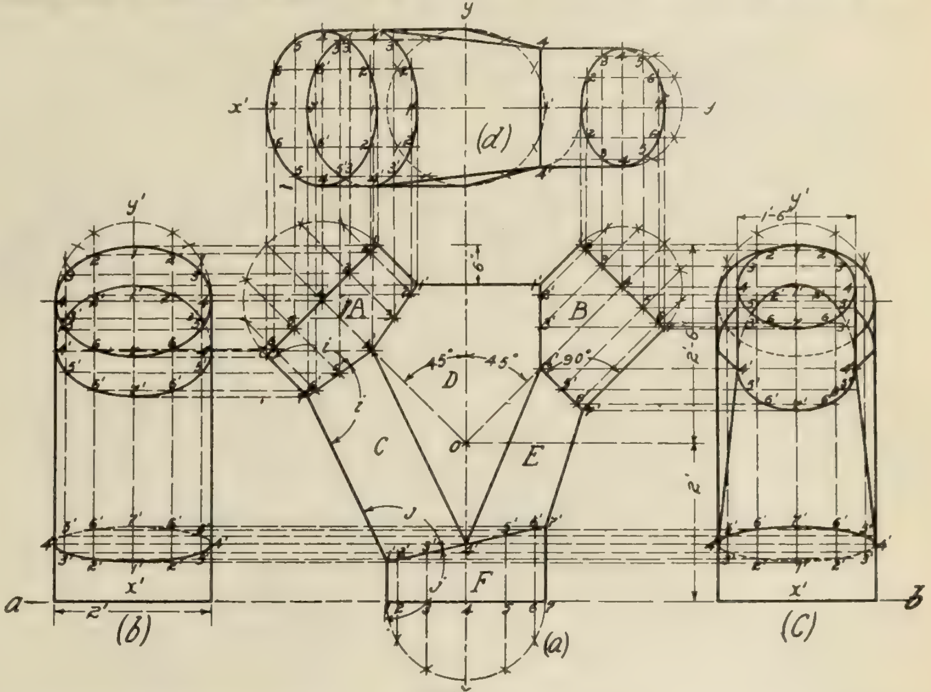

FIG. 1.

From the point 1^1 at B, drop a vertical line, cutting the centre line 0, 4 at 4, and from this point draw a line at right angle to the centre line. Connect the points $4^1\ 4^1$ and $7^1\ 7^1$, thus forming the piece E.

Top and Side Elevations

The two side elevations, and also the top view, can be obtained by the ordinary method of projection, care being taken to have similar points in the various views numbered alike. On the centre lines of both side views at a convenient point describe semicircles equal to the diameter of the corresponding pipes, and divide each into a certain number of equal parts, generally twelve divisions to a circle. The vertical projections for the side elevations are obtained from these circles, and the horizontal intersections are obtained from corresponding divisions on the front elevation. The top view is obtained in a similar manner, the horizontal projections being obtained from the construction circles, and the vertical intersections obtained from corresponding points on the front elevation; the ellipses representing the several openings and joints being drawn through the various intersections.

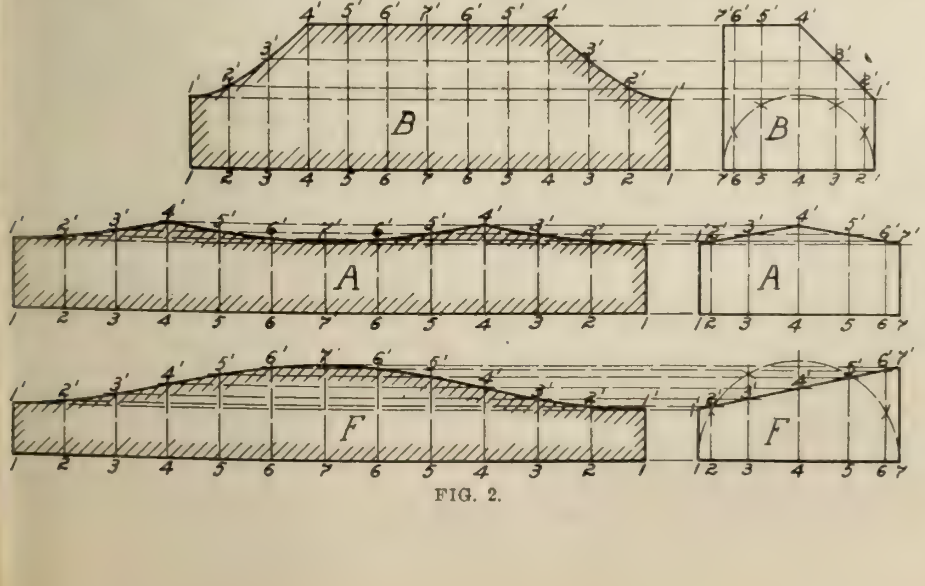

FIG. 2.

Developing Cylindrical Sections

The developments of the three cylindrical pieces, A, B and F, are shown in Fig. 2. The elevation of the three pieces are shown on the right. A semicircle is described on the base line and divided into six equal divisions; the projection of these points cutting the base and angular faces in the points shown. On the base line of the development twelve divisions are marked off, each equal to one-twelfth of the circumference of the pipe, and numbered with the corresponding points in the elevation, the line 1, 1^1 representing the seam in each piece. Vertical lines are erected from each division on the base line, the intersection for the irregular curve being obtained from the horizontal projection of the corresponding points in the elevation. In developing these surfaces, no allowance has been made for seams—sufficient metal must, at these points equal in length to the lines 3, 3^1—4, 4^1—5, 5^1, etc., in the semicircles at either end of the pipe connections. The length of the lines 2, 3^1—3^1 4^1, etc., in (h) will be the true length of corresponding lines in the elevation. As each half of the pattern is symmetrical, it can be developed on either side of a centre line.

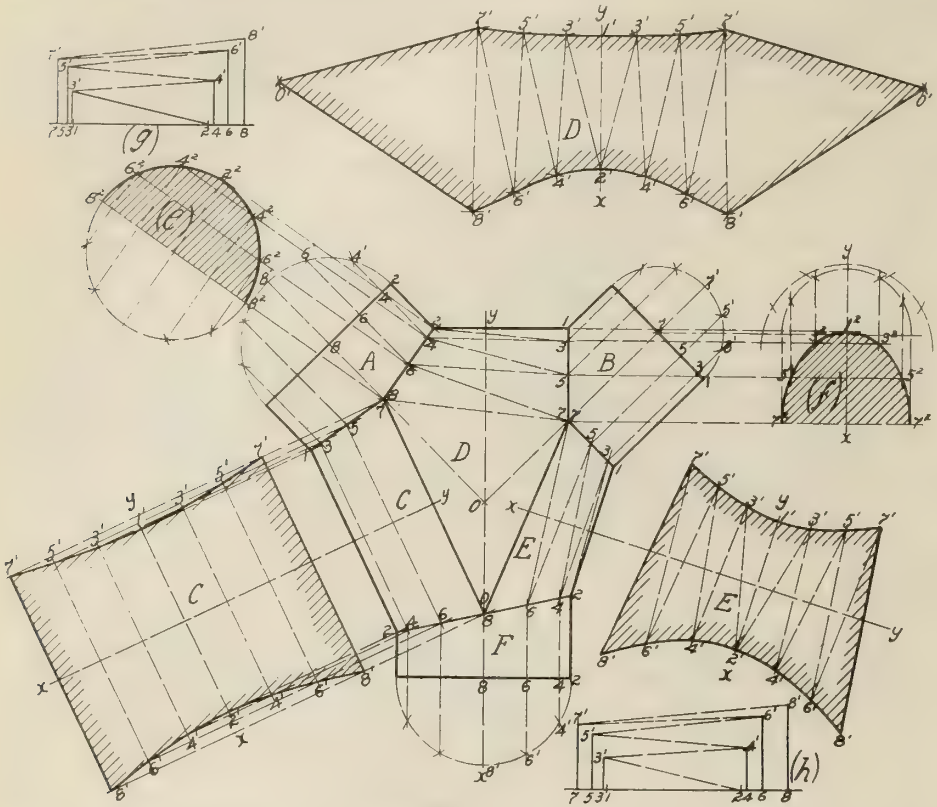

FIG. 3.

therefore be added where necessary, depending upon the style of joint used.

Transition Development

The development of the three transition pieces, C, D and E, is shown in Fig. 3. The piece C is developed similarly to those shown in Fig. 2. The centre line xy is drawn at right angle to the line 1, 2 in the elevation, and on this line six equal divisions are marked off, each equal to one-twelfth of the circumference of a 2-foot pipe. From these points on the centre line xy perpendicular lines are drawn, and the intersections of these lines with projections from the section C in the elevation are the points on the irregular curve.

The developed shape of the transition piece E is shown to the right of the elevation. To obtain the true length of the various radial and diagonal lines the triangulation method is used. The line 1, 2 being on the centre line of the side view, is, therefore, the true length in the front elevation, so with this as a basis we can proceed to obtain the true lengths of the other construction lines. On the base line at (h) lay off the various lengths, 1, 2—2, 3—3, 4, etc., as shown on E in the elevation, and erect perpendiculars

At right angle to the centre line xy erect the line 1^1 2^1, equal in length to the line 1, 2 in the elevation. With 2^1 as centre and 2, 3^1 in (h) as radius, describe an arc that intersects at 3^1 with one drawn from the point 1^1, with a radius equal to one-twelfth of the circumference of an 18-inch circle. Then with 3^1 as centre and 3^1 4^1 in (h) as radius describe an arc that intersects at 4^1 with one drawn from the point 2^1, having a radius equal to the distance 6^1 7^1 on the curved line in F, Fig. 2. The development of E can be completed by following the method just described, noting carefully the corresponding figures and lines; the length of the line 8^1 8^1 in E will be of the same length as the curved line in F, as contained between the points 4^1 4^1.

The development of the transition piece D is shown at the top of Fig. 3, and is derived similar to that of E. The end portions that connect the two branch pieces, A and B, are divided by projecting lines from the semicircles as shown, the points 1, 2, 3, etc., forming the extremities of the radial and diagonal construction lines. The true shape of the ends are shown at (e) and (f), obtained in like manner to that described in Fig. 1. The true length of the construction lines in the elevation are shown by the cross lines in (g) Fig. 3, and are obtained the same way as in (h). On the centre line xy of the pattern D lay off the distance 1^1 2^1 equal to the line 1, 2 in elevation, and with 2^1 as centre and the length 2, 3^1 in (g) as radius, describe an arc that will intersect one drawn from the point 1^1, having the length 1^2 3^2 in (f) as radius. Then with 3^1 as centre and 3^1 4^1 in (g) as radius, describe an arc that will cut another arc drawn from the point 2^1, having the length 2^2 4^2 in (e) as radius. Proceed in this manner until the line 7^1 8^1 has been obtained, taking care that the curved line 7^1 7^1 in the pattern is the same length as that in (f) and the line 8^1 8^1 the same as the curved line in (e). Now with 8^1 as centre and the distance 7, 8^1 in (c) as radius, describe an arc at the apex 0^1, and from the point 7^1, with the line 7^1 8^1 in (h) as radius, describe an arc cutting the other at the point 0^1. Then lines drawn from the point 0^1 at either end to the points 7^1 and 8^1 will complete the development of the transition piece D.

* * *

GRINDING LATHE AND PLANER TOOLS.

THE desirability of having the grinding of tools done by one man is being more widely recognized, but it is not always feasible to have it done. After having read Fred W. Taylor's truly remarkable treatise "On the Art of Cutting Metals," and having had several interesting interviews with modern mechanics, a writer in Grits and Grinds states that at least two things made a strong impression on his mind in connection with the grinding of high-speed lathe and planer tools:

a. They are ground successfully both by the free hand method and by automatic tool grinding machines.

b. It is common practice to grind both wet and dry.

Taking up first hand vs. machine method—the machine method of grinding is safer and more satisfactory except in instances where there are real mechanics who possess both mechanical horse sense and skill.

The advantages of hand grinding are It gives the operator a little better opportunity to regulate the angle or rake to suit the work. Since he must grind the tool many times each day he should be able, if a good, observing mechanic, to improve the cutting edge with each grinding. This remark was recently made by a man who is interested in keeping up the efficiency of the shop "There is just about one man in ten who grind tools in this shop who can grind a lathe tool better by hand than a machine will grind it and it is mighty poor policy to let any green man grind by hand."

The parties whose interests are on the side of the automatic tool grinding machine have good arguments why machines should be used exclusively. Saving of workmen's time, saving of time lathes and planers would stand idle while tools are being ground, the correct grinding angles, life of the tool, quality of work, increased production and a smaller investment in high speed steels are some of the talking points.

Wet vs. Dry.

Whether to grind high-speed steel wet or dry is still being debated, and it is being ground successfully by both methods—take your choice. The most approved practice, in so far as the writer can learn, is to grind wet whenever practicable. Reference to the printed instructions issued by four of the principal high speed steel makers disclosed the fact that two of them instruct the users of their product to "grind on a wet wheel" and two to "grind on a dry wheel."

When grinding wet a copious stream of water must flow at low velocity directly on the nose of the tool. It should be ample to take up the heat as fast as it is generated. A little water is far worse than no water at all as it is the direct cause, many times, of surface cracks and checking. When grinding wet do not grind too forcibly as the water is thus temporarily kept away from the surface being ground, and when the tool is released the cold water strikes the hot surface causing it to check and surface crack.

It is not unusual to find tool grinding machines in use that are not properly provided with a sufficient water supply and there are cases, too, where the workmen grind without turning on the flow of water full force because it is somewhat disagreeable to grind a small tool by hand under these conditions. Both are costly; high-speed steel is too expensive to be thus damaged.

The advocates of dry grinding contend that "high-speed cannot be damaged by dry grinding" and that the green man will have less trouble by the dry method. The superintendent of a shop where both wet and dry methods are used for lathe and planer tools, remarked: "There is one advantage in grinding dry, particularly short tools—the grinder can't force the grinding too hard: if he does he'll burn his fingers."

There is a temptation when grinding dry to plunge the hot tool in a bucket of water to cool it off. This is considered by many poor practice.

Lip and Clearance Angles of Tools

Taylor says:

"For standard shop tools to be ground by a trained grinder or an automatic grinding machine a clearance angle of six degrees should be used for all classes of roughing work."

"In shops in which each machinist grinds his own tools a clearance angle of from 9 degrees to 12 degrees should be used, because in nine cases out of ten the workmen grind the clearance and lip angles of their tools without any gauges, merely by loking at the tool and guessing at the proper angles. Much less harm will be done by grinding clearance angles considerably larger than six degrees than by getting them considerably smaller."

"Tools for cutting cast iron and the harder steels, beginning with a low limit of hardness, of about carbon 0.45 per cent. should be ground with a clearance angle of six degrees, back slope eight degrees, and side slope 14 degrees, giving a lip angle of 68 degrees."

"For cutting steel softer than carbon 0.45 per cent. clearance angle six degrees, back slope of eight degrees, side slope of 22 degrees, giving a lip angle of 61 degrees."

"Chilled Iron—a lip angle of from 86 degrees to 90 degrees should be used."

"Steel as hard or harder than tire steel; clearance angle six degrees, back slope five degrees, side slope nine degrees, lip angle 74 degrees."

"Extremely soft steels, carbon 0.10 per cent. to 0.15 per cent. use tools with lip angles sharper than 61 degrees."

"Tools ground with lip angle of about 54 degrees cut softer qualities of steel and also cast iron, with the least pressure of the chip upon the tool."

Tools for Special Holders.

Many shops are now equipped with special tool holders which permit the use of small bits of high-speed steel instead of solid forged tools. The grinding of these tools for special holders is a somewhat different proposition from the grinding of solid forged tools due to the fact that the holder socket may be inclined at an angle to the lathe centres. It is necessary when such is the case to add the desired amount of clearance to the fixed angle of the holder socket. For example, if six degrees of clearance is wanted for the tool when at work and the holder socket is inclined at an angle of say 16 degrees the tools should be ground at an angle of 22 degrees. This is a point frequently overlooked, except when the tool grinding machine is provided with a special holder for grinding them or when the bits are ground in the holders.

Lathe Chips.

The lathe man is usually interested in the shape of lathe chips he is getting. He considers a long, stringy ribbon chip a dangerous kind because it is likely to wind up around the work and to swing around and slap him in the face. A common trick of the old-time mechanic, in order to guard aganst the dangerous chip, is to grind a little groove across the top of the tool a short distance back from the cutting edge—say about ⅛in. to ¼in.. The groove should not be too deep. This has a tendency to break up the chip in short pieces or roll it in a coil which is easily taken care of. The kind of chip referred to above is more likely to be found when working soft and tough steels. Hard, brittle steels break more easily. Cast iron does not give trouble in this respect as the material does not hold together

Some Good Points to Remember.

The surface of the tool should never be allowed to fit closely against the surface of the grinding wheel for any great length of time. Keep moving or wobbling the tool about while grinding.

Practical machinists who grind their tools incline towards too little rather than too much side slope. Steep side slope is avoided for reasons of economy.

It is economical to have on hand a sufficient supply of tools that the dull tools may be laid aside to be ground in lots or batches. It is also probably economical for even the small shop by such a system to use an automatic tool grinding machine.

There is greater economy in the automatic tool grinding machine where standard shapes for all tools have been adopted.

It is a common practice among workmen to use the side of a grinding wheel to finish grind. It should always be kept in mind that the side of a straight wheel was never intended to be ground on and the man who uses the side is not observing the "safety first" rules. There may be some cases where even a slightly concaved edge on the tool would be objectionable, but it is doubtful if there is enough concavity when the average size grinding wheel is used to make any difference in the action of the tool. Should it be so, the remedy is to grind on the rim of a cup or cylinder wheel.

Should special men be delegated to do all the grinding of cutting tools and be provided with suitable templates and gauges

"Yes," a superintendent replied, "but we don't do it here, and I don't think there are many shops where the plan is entirely practical. We have five or six lathe and planer departments and no one of them is large enough to support an automatic grinding machine. They are too far apart for a common grinding department. That would be an ideal plan if the conditions were ideal, but they're usually not."

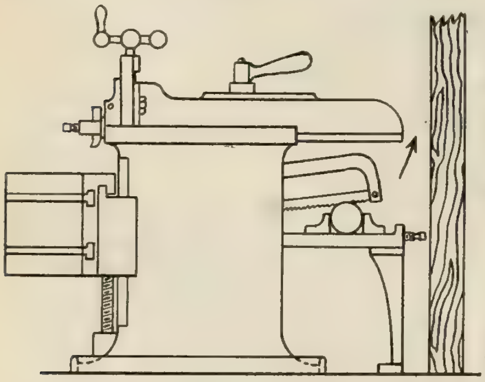
"SAFETY FIRST"—LOCATING MACHINE TOOLS

by R. Hamilton

THERE is an old saying that "Prevention is better than cure." This proverb is not only true in the physical sense of its meaning, but it can also be applied to good purpose in the routine of every-day work.

Twofold Influence

Among the various developments due to efforts to provide better protection for all classes of workmen, the placing of machinery is one of increasing importance, not only in direct relation to the men as individuals, but in its influence on the results obtained through other precautions whether practical, such as protective apparatus and devices, or moral, consisting of instructions, warnings, etc. When equipping a new shop for the manufacture of a certain product, the layout of the machine tools can be so arranged as to obtain the highest possible efficiency, both in production and economy, but, when it is necessary to install additional machinery in a shop already equipped, it often becomes a problem just where to locate the extra tools.



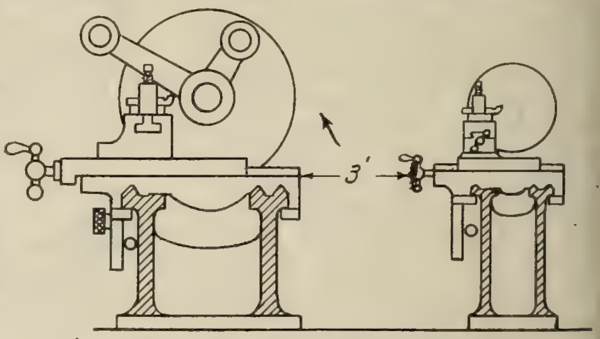
SHAPER TOO CLOSE TO WALL.

The proper placing of machine tools, especially when the equipment is being added to, is very essential not only with regard to its productive efficiency, but also as regards the safety of the employees, operating the various tools.

A Common Cause

One of the great sources of accidents in metal working shops, is the frequent over-crowded condition of the plant; not only in the quantity of the heavier tools, but in the general condition of the space between the machines, and the main aisles of the shop, in which an unnecessary amount of material is often allowed to accumulate.

The free movement of the workmen in the discharge of their duties, should be one of the chief considerations of the executive, as the efficiency of a plant depends largely upon the elimination of unproductive action on the part of the employees.



LATHES TOO CLOSE TOGETHER.

Dangerous Thoughtlessness

Many machines are located in such a position that the precautions required in their operation result in considerable loss of time, and occasionally in injury to the workmen. While in a shop some time ago the writer noticed a power hack saw placed alongside of a 16 in. shaper, the ram of which travelled back to the wall, when on the full length of stroke. To place a short bar in the hack saw vise, it was necessary for an operator to crowd in at the rear of the shaper to support the end of the bar. While no accidents have actually happened, there has been several narrow escapes of heads and arms being crushed, owing to the shaper hand starting up his machine while a bar was being placed in the saw.

Gap Lathe Location

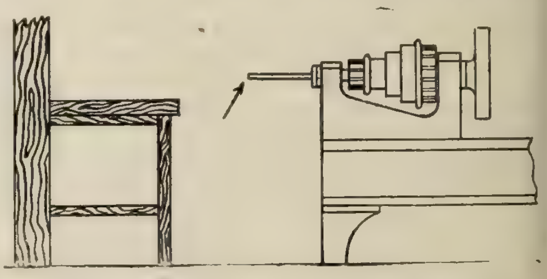
The location of a gap lathe is connection with the safety of workmen, other than the operator—should be given careful consideration, as the possibilities of accident are often overlooked. Plenty of room should be provided, both at the front and rear of the machine, and a suitable guard placed, if necessary, to prevent passing workmen coming within the danger zone. In some plants the use of a gap lathe is seldom required, and when used is mostly for circular work; but when this tool is operating on odd-shaped pieces, such as bell cranks, connecting rods, etc., the possibilities of accident from projecting portions is often very great.

Some time ago in a certain shop known to the writer a job was being performed in a large gap lathe, which necessitated an arm of the work extending for a foot out from the rim of the face plate. The rear of the gap lathe was located about three feet from the working side of a small engine lathe. While the workman on the smaller machine was taking a step backward, to remove a piece of work from his lathe, the large lathe was suddenly started, the swinging piece striking the workman a violent blow upon the arm, that resulted in a lay off for several days. Another objectionable feature in connection with these two machines was that the operator on the smaller one had to stop his work and stand to one side while heavy work was being hoisted into the larger lathe.

Obstructing Thoroughfares

Another common cause of accident is the placing of hollow spindle lathes and turret machines, in such a position that the work often extends partly, or entirely, across an aisle or section of a shop where there is considerable traffic. If it is a general practice to operate on long bars, the workmen get the habit of using another passage, but if only occasionally used, the chances are that a workman may receive injury before he can be warned.

Over a year ago an accident occurred in a certain shop, where his coat was torn from the back of one of the workmen. A bar was extending part way across a passage that was much used when one of them—a new man—in passing the end of the lathe, came in contact with the revolving bar, and before he could retreat, the end became twisted in his clothing with the result above



STOCK PROJECTING OVER PASSAGEWAY.

Many other cases might be cited where more or less injury and near accidents have resulted from machines being located in positions that have necessitated the workmen taking risks which would otherwise have been avoided if proper consideration had been given to the placing of machine tools. If, after a machine has been placed in a certain position, it is found that an additional hazard has developed, the danger should be immediately minimised, if not entirely eliminated by the provision of such guards as it is possible to install.

* * *

MACHINISTS' INSTRUCTION COURSE—VII.

IN order to turn a parallel bar between the lathe centers it is necessary for the lathe centers to be in line with each other and with the line of movement of the tool rest. To test this, use a bar about 2 ft. long with a small portion at each end turned to the same size or slightly less in the middle for clearance, set the tool to just touch one end of the bar, then run the carriage along to the other end and if the tool does not touch at the other end move the tailstock whichever way it needs to go, until the tool exactly touches either end of the bar. If the end of the tailstock is not already marked make a reference mark with a fine chisel, so that it can be put back to the same place if you need to move it at any time.

If you have no test bar or no time or opportunity to make one, try out the centers by using the job in hand. Turn a small portion at each end to the same size, then, instead of undercutting the middle for clearance, set the tool to touch the turned portion at the live center end, take the job out of the centers, or if it is a light job turn back the tailstock center enough to allow you to run the carriage to the other end against the centers and test as before. If the job is too heavy to conveniently take out of the lathe, note the graduations on the cross feed screw or make a reference mark on same anl see that the tool just touches each end of the turned portion when the reference mark on cross feed screw is the same. Another result of the centers not being in line can be seen by facing the end of the work between the centers, when, by placing a straight edge across the end, it would be found that the end would be concave or convex, according to which way the tailstock needed to be moved, as the centers have to be exactly at right angles to the cross slide to produce a flat surface.

Selecting a Tool

Volumes have been written about the theory of cutting tools, but to specify the exact size and shape of all the different lathe tools is outside the scope of these articles. The shape of the tool depends entirely upon the nature of the job and the kind of metal to be cut. Generally speaking, the softer the me to be cut the sharper the tool, while with hard metal there is less clearance. If it is a light spongy job, the tool ought to have a comparatively narrow nose with lots of side clearance so that the cuttings will slide off with the least-possible resistance. Cast iron can be cut with a broader nosed tool than wrought iron or steel, because the chips break off more readily and thus relieve the tool, allowing a broader nose and rougher feed.

Height of Tool

It is important to have the tool at the right height, so in oraer to insure this make a mark on the tailstock spindle exactly the height of the lathe center, put a parting or cutting off tool in the tool post and adjust it to the exact height of the lathe centers. Now slightly press it against the tail stock spindle and run the carriage along making a permanent mark on the tailstock spindle about 2 inches long, Fig. 30. This will be found very convenient especially when setting the tool for taper work as will be shown later.

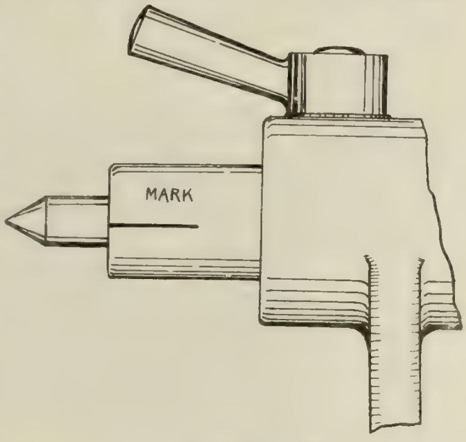


FIG. 30.

Set the tool a little above the center; by using the reference mark on the tail stock spindle, you will know exactly the height of the tool in relation to the lathe centers. The larger the diameter of the work the higher you can set the tool above the lathe centers with advantage. Avoid setting the tool below the center, because if there is any lost motion in the screw or slackness in the slide, the tendency is to pull the tool into the work, when without warning, the job will climb over the top of the tool and jump out of the centers. Fasten the tool in the tool post as close to the cutting edge as possible and keep it quite clear of the work while doing so.

The First Cut

Making the first cut is entirely a matter of judgment. Try the calipers on it as soon as you can but be careful not to take too much off at the first trial as there are no lathe putting-on tools. After adjusting the cut to the right size start the feed and let it run half way up the bar, then remove the work, run the tool back to the starting point, replace the work in the reverse position, and let the same cut run over the part that has not been turned. The work will now be the same size at both ends and the cut will meet in the center. If the live center should not run perfectly true, it will be least noticeable where the cuts meet in the middle of the bar.

If it is necessary to take a number of cuts and a very accurate job is wanted, it is best to reverse the work at every cut so that the centers will wear even. Before clamping the dog on to a finished surface, place a piece of sheet brass about the size of a postage stamp under the set screw to save marking the surface.

Always grind the tool before taking the finishing cut. Finishing tools, as a rule, will stand a little more rake on top than roughing tools. Take the finishing cuts with a fine feed and at as high a speed as the tool will stand up to, considering the diameter and length of the job being done.

Measuring With Calipers

A good lathe hand can with care detect a difference of .001 inch with an ordinary pair of spring calipers. They should be held lightly between the thumb and fingers of the right hand, while the thumb and forefinger of the left hand hold one of the caliper points stationary on the piece to be calipered. Gently swing the other point across the work, and move it in and out until you find the place where the point has the least travel. This is the smallest diameter that can be found, anl is at right angles to the axis of the shaft. When, this point is determined, let the calipers pass over with a very slight pressure; some prefer to let the calipers pass over without touching, noting very carefully the amount of side play or travel of the calipers at the smallest part and then have the same conditions exactly on the plug or piece that they are measuring from . This is probably the most accurate way, but it requires some experience as it depends more upon judgment than sense of touch.

Turning to Gauges

If the shaft has to be turned to fit a ring gauge it must of necessity be a few thousandths less than the ring gauge, depending upon the diameter, as a ring gauge of 3 in. diam. for instance will not pass over a 3 in. plug although sometimes plug and ring gauges are made to pass over each other especially home made ones.

When using plug and ring gauges remember that the kind of fit that the ring and plug gauge make with each other is exactly reversed in the work. If the plug and ring gauge will not go together, the work made to them must. If the ring and plug will pass over each other the work may not, as it would depend on whether the work was a closer fit than the plug and ring gauges are to each other. These conditions apply when the hole in the work is made to fit the plug, and the shaft turned to fit the ring, so that if plug and ring gauges were being made for parts that were wanted to be a forced or driving fit, it would be necessary to make the gauges so many thousandths slack.

❖

MANUAL POWER

By A. L. Haas.

WHEN labor is extremely cheap, as in most Asiatic countries, ordinary sources of power and labor-saving devices of the West are from this cause relatively dear and the more primitive human muscle continues in use as the chief source of energy.

At home a metal turning lathe seems inseparable from overhead shafting. In India, China and elsewhere, native labor being abundant and cheap, lathes up to 10-in. centres of modern type, with flared heads, are propelled by treadle. Occasionally the treadmill device of a heavy flywheel separately mounted and operated by four to eight men is used. Recently an engine lathe so fitted came under the writer's notice, 9 in. centres, 10 ft. bed, destined for the Far East.

In the absence of other motive power, or by reason of economy, such method of propulsion of a modern tool, while quaint, may be desirable. Where labor is cheap, time of small consequence with depth of cut, feed and speed proportioned to muscle rather than conditioned by scientific practice, more work of this character is done than is generally realized in more civilized places.

For repair purposes, as apart from manufacture, the gear to accomplish the desired end is of greater moment than any attempt to utilize high speed steel to its ultimate capacity.

It seems likely that at least 30 per cent. of the regular type engine lathes are used for isolated repair plants, and not for manufacture at all. Only on this supposition can the yearly demand and output be explained in normal times.

A Primitive Lathe

The most primitive type of lathe with which the writer is acquainted, possibly its original form, survives in parts of the Nearer East termed the Levant. Among the trophies brought home by the tourist to Egypt are articles made up of a multiplicity of small pieces of turned wood.

The operator whose limited kit, including his "lathe" is carried on his person, squats in some convenient corner. He thrusts two pieces of wood, having metal centres, into the ground at his feet. A bow with a loose string is his motive power, and with a supply of material he is ready for a start. The bow is placed one turn round the work between the centres. A chisel held between the toes for rest forms the cutting tool. The bow is moved ceaselessly backwards and forwards with the left hand, the right and the toes (which never having been shod are very flexible) manipulate the chisel. The device is at least as old as the traditional potter's wheel, and antedates the pole spring lathe common enough a century ago. Quite complex shapes, necessarily small, are made with great dexterity and speed.

A Modern Tinker

A man known to the writer has contrived to effect a living by various devices in many primitive lands. One experience of his concerns his life in Paraguay thirty years ago.

In some unexplained manner he found a derelict lathe for sale at a nominal figure in a coast town; it was 6 in. screw-cutting, with reasonably full kit, and is yet in existence, as he brought it home subsequently. To it he added a portable forge and some miscellaneous gear. Hiring a wagon and horse, he set out in the manner of the country tinker, immortalized by Bunyan seeking work.

The wagon journeyed by devious ways from racienda to hacienda, and the jobs he managed to accomplish were many. He quoted a price for any work or repair within his capacity, until he left the gear at the ranch in good shape, travelling on again in quest of work and adventure. Sometimes he stayed a week, sometimes a month; very rarely was he refused work. In fact, he makes out that he had a sort of royal progress from place to place. There was no dearth of labor miners' skill, and the treadle of the lathe was never propelled by his own foot. Subject to any scruples he had, his prices were never subjected to question. and the need for his services was evident. Agricultural machines laid aside for some defect he was able to put into commission again. The facilities for purchasing new machines were abundant. opportunity for skilled repairs absent. Hence my enterprising friend obtained a warm welcome and achieved a modest competence by the supply of a veritable lack in a sparsely settled community.

The future of the travelling workshop and a record of its adventures would make an entertaining volume if these were adequately rendered into print.

Price Depends on Place

Skill of the right sort at the right place, where this is isolated, commands a ready welcome and high pay. In Brazil only a couple of years ago an erector of aerial ropeways was paid £50 to travel free of cost a matter of 100 miles to lay up an 80-ft. splice in another ropeway. It was just the exercise of unusual skill in an isolated spot, the fee was paid, as it was cheaper than to bring a man from the coast to do the job.

Another instance of manual labor or power occurs in places of detention and punishment, in prisons where work is done neither for pay nor affection, but as forced exercise.

In a large institution of the kind it is difficult in Asiatic countries to devise tasks of a utilitarian character. To instal power in view of the overplus of labor would be superfluous. So that corn is ground and water pumped by the application of human muscle.

The favorite device for water supply is a three-throw well pump actuated by a capstan. Such a device may utilize up to 50 men for a couple of hours per day.

Curing a Defect

In connection with a large capstan of the kind for 48 men, the designer who had experience with much smaller capstans provided 10 feet bars, 16 in number. He provided the bars of a size in his judgment sufficient, and these could not be increased in size without a larger head. With only two men at the end of a bar it both sagged and bent considerably, in spite of its initial upward rake. The amount of safe deflection possible at the end of a well-supported ash pole, 10 feet long, must be seen to be believed. The capstan erected for test proved unsatisfactory for this reason.

To remedy the defect in the cheapest manner, the bars were trussed as follows.—A piece of flanged C.I. pipe was bolted flange down on capstan head. This had $\frac{7}{8}$-in. holes in the same radial position as the bars at the upper end of the short pipe; $\frac{3}{4}$-inch rods, double nutted at the pipe end, were led to clips at mid-section of the capstan bars. These clips were connected bar to bar radially by $\frac{3}{4}$-inch double-eye links.

The completed job was quite sightly, the entire capstan now moving like a cart wheel with projecting spokes.

It may be added that the bars (as is usual in such case) were bolted in capstan head. Accidents resulting in serious injury having been known owing to accidental unshipping of a bar while under way. The permanence afforded by the trussing was in this wise not detrimental to the finished job.

❖

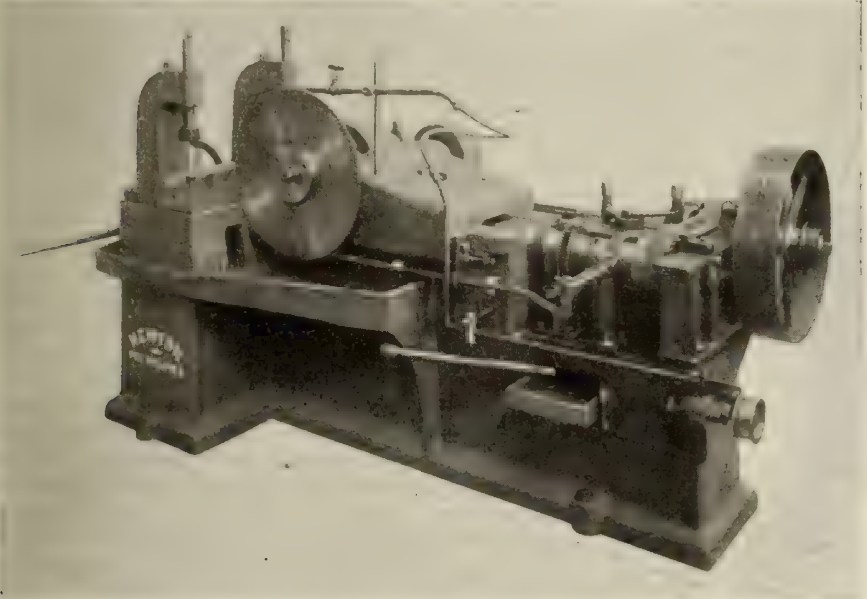
Ottawa, Ont.—The Haynes Motor Co. may establish a plant here at a cost of approximately $40,000.

PROGRESS IN NEW EQUIPMENT

A Record of New and Improved Machinery and Accessories for the Machine, Pattern, Boiler and Blacksmith Shops, Planing Mill, Foundry and Power Plant

SMALL COLD METAL SAWING MACHINE

THE cold metal sawing machine illustrated herewith has been designed to meet the demand for a machine to handle solid bars in individual sizes up to $5\frac{1}{2}$ in. dia., and smaller stock that can be grouped into an equivalent section. Ordinarily it is equipped with a 20 in. dia. high speed steel blade of either the solid or inserted teeth type to enable the maximum capacity of the machine to be maintained. Every possible precaution has been taken to prevent the occurrence of chatter.



GEAR FEED 20 IN. COLD METAL SAWING MACHINE.

The machine is of the spindle driven type with spindle revolving in capped bearings and driven by spur gears through worm and worm wheel, the worm wheel being of solid bronze, and the worm fitted with roller thrust bearings. A very essential feature is the front bearing for the feed screw, which insures its operating tension.

The saddle has underlocking gibs cast solid with vertical and horizontal adjustments made by taper shoes and fast power return for the saddle is provided in addition to a gear box giving changes without removal of gears. The saddle is also fitted with trips to stop the feed at any pre-determined point, and safety stops are provided for each of the extreme positions of travel.

Generous oil pans, cast solid with the base, are also provided, and the lubricant is located in the rear inside the base. Pump, piping and attachments are supplied to deliver the lubricant to the point of cutting.

A departure from accepted practice in the design is the inclusion of a gear feed, experience having demonstrated that a friction feed that is powerful enough to advance the blade will cause as many breaks, if any, as gear feed. The machine illustrated has been successfully demonstrated to cut off 6 in. .50 carbon stock in three minutes, or at a feed of 2 in. per minute, the equipment when fitted with high speed blades being guaranteed to cut in its average capacity a feed of 1 in. per minute.

This machine is a recent product of the Newton Machine Tool Works, Inc., Philadelphia, Pa.

1 IN. x 7 IN. TURRET HAND SCREW MACHINE

THE 1 in. by 7 in. turret hand screw machine shown in the accompanying illustration, is now being placed on the market by the Stenotype Co., Indianapolis, after being successfully tried out in the hands of several purchasers.

As shown in the illustration, this machine is fitted with a plain three-step cone of large diameter and face, giving great power for all spindle speeds. It will be noticed also that a guard is provided for the cone in the form of a well entirely covering the lower half of the cone. This also serves to tie the front and rear bearings rigidly together and thus assist in maintaining the rigidity of the spindle.

The headstock is cast solid with the bed, eliminating the possibility of the spindle working out of alignment. The cut-off is large and well proportioned, with broad, well gibbed bearings, insuring firmness of the tools under heavy cuts. The hand wheel for adjusting the position of the cut-off is provided with a large diameter dial with adjustable clips, so that the different shoulder lengths can be accurately duplicated. The turret slide and saddle unit is provided with a supplementary base and taper gibs for vertical and horizontal adjustment.

The slide is operated by turnstile and rack and pinion, and the turret is automatically indexed by the backward movement of the slide. It is held firmly in its seat by a large steel stud upon which it revolves. This stud is tapered and provides adjustment for taking up wear and is so bored that long stock can pass through the turret, thus permitting the use of short, stiff tools. The lock bolt is of large diameter and is a special grade alloy steel, hardened, ground and lapped. It operates vertically, locking into hardened and ground steel turret bushings, and is provided with a taper end working into a taper hole in the bushings so that the turret is locked firmly in position. This locking position is at the front end of the slide, almost directly under the tool. The holes in the solid hexagon turret are $1\frac{1}{4}$ in. diameter with binder bushings for holding straight shank tools, and each face of the turret has four $\frac{3}{8}$ in. tapped holes for bolting tools direct to the turret.

The tool holes in the turret are bored in the machine itself after assembling, to insure that the holes line up with the spindle. Six stops are provided, one for each face of the turret, and when set they operate automatically for each position of the turret. They are threaded for their full length and each one is provided with a binder for clamping it into position when set.

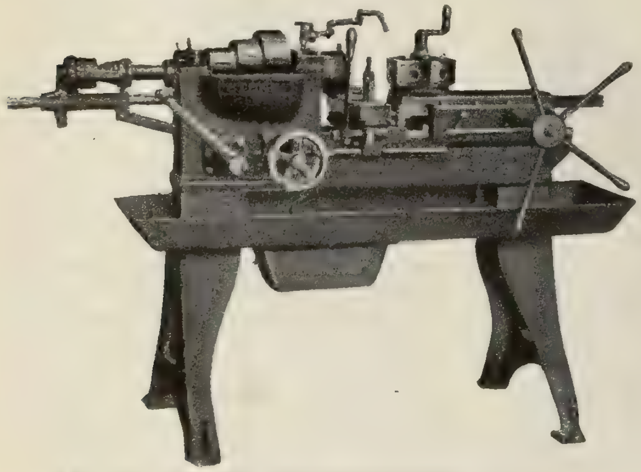
The spindle is a high carbon steel forging, carefully ground to size. Bearings are die cast from a special composition of high grade babbitt. All bearings are carefully scraped by hand for fit and to insure correct alignment of spindle. They are of very liberal dimensions to enable them to stand up under the most severe duty. Sight feed oilers are provided for lubricating spindle bearings. The spindle nose is of large diameter, threaded and provided with pilot end and is so constructed that the overhang for either bar chuck or casting chuck is reduced to a minimum. Adjusting collars with hardened and ground thrust washers are provided for taking up end thrust.

The automatic chuck and bar feed, operated by the long lever at the left of the machine, grips the bar instantly and releases it completely. One movement by the operator serves to open the chuck and feed the bar without stopping the machine. A stepped wedge, operating the fingers automatically, compensates for slightly varying diameter of stock. Collets can be changed quickly by unscrewing collet hood. Collets and collet hood are hardened and then ground, to insure great accuracy. Chucks or fixtures for extra size pieces can readily be attached to spindle nose in place of collet hood.

The oil pan is of pressed steel, avoiding entirely the possibility of breakage. The oil reservoir is of cast iron bolted to the pan and is provided with a strainer to prevent chips from entering. The screw plug in the bottom of the pan provides for draining oil and for the removal of sediment. The oil pump is driven by a separate belt directly from a pulley on countershaft and operates equally well in either direction. It delivers an ample supply of oil, distributed by means of an adjustable pipe. A partition in the reservoir prevents the possibility of sediment entering the pump.

All parts are made from jigs and fixtures and are carefully inspected and gauged before assembling, thus insuring interchangeability, and giving a machine which can be relied upon to do close, accurate work.

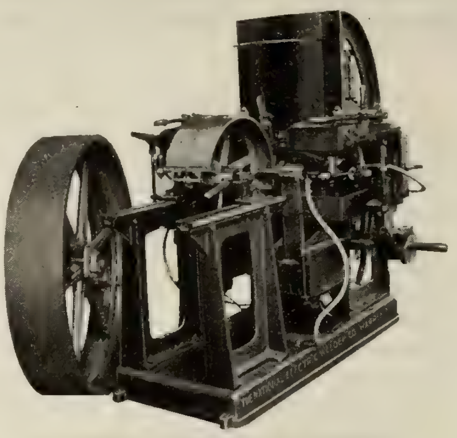
The principal dimensions of this machine are: Bar stock capacity through automatic chuck, 1 in.; swing over bed, 13½ in.; swing over cut-off, 6 in.; cut-off travel, cross, 5½in.; longitudinal, 9 in.; holes in turret, 1¼ in. dia.; hole in spindle 1 9-32 in.; width of belt, 2¾ in.; net weight, 1,375 lbs.



1 IN. BY 7 IN. TURRET HAND SCREW MACHINE.

NOVEL ELECTRIC WELDER

THE electrical welding of pulley fillers to the rims is now being done in a specially built machine which automatically performs the necessary operations on circular work ranging from 12 in. to 60 in. dia. The accompanying illustration shows the machine along with a sample pulley welded by it.



ELECTRIC WELDER FOR STEEL PULLEYS.

Two complete and separate welding equipments are provided, one on each side of the centre of the pulley, and each makes 60 welds per minute with a motor drive and automatic switch. The welding mechanisms move away from each other to give a clearance of 12 in. between the welding points, which are water-cooled, and will operate within a space of 2½ in. radially from the centre of the arbor.

Feeding and stopping are automatic, the feed device being adjustable from ½-in. between welds up to 3 in. or more as desired. The stops automatically trip off and stop the machine when it reaches the separation strip on the pulley.

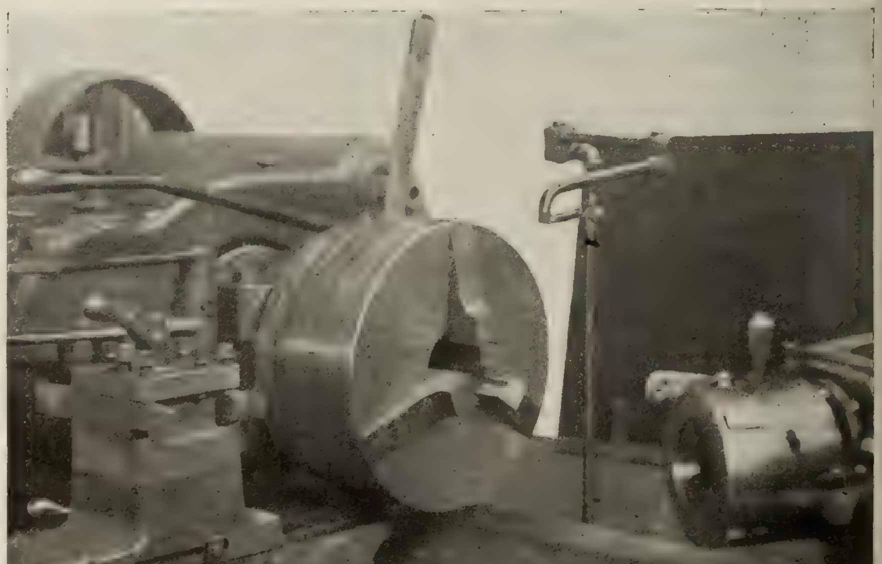
In addition to its large range of automatic operation, the machine is notable for the small number of moving parts and simplicity of construction. The floor space required is 50 in. by 66 in., and weight is approximately 3,500 lbs. The machine is built by the National Electric Co., Warren, O.

◆

WRENCHLESS CHUCK

THE accompanying cut illustrates a new development of the Barker Wrenchless Chuck, which is made by the Thomas Elevator Co., Chicago. The principal feature of this chuck is the rapidity with which the work can be handled, thus effecting a considerable saving of time in chucking operations.

The operating mechanism is in the form of a planetary-gear arrangement all enclosed within a casing, which is carried and held central on the hub of the chuck, and is kept from rotating by means of a U bar that straddles the headstock or any convenient projection fixed solid with the machine. The slot in the casing exposes the outside diameter of the movable internal gear to which the hand lever is fastened. The hand lever movement is imparted from the internal gear through suitable pinions to the cam which in turn actuates the jaws The same action takes place while the chuck is in motion as well as when at rest.



WRENCHLESS CHUCK FITTED TO TURRET LATHE.

Since the position of the hand lever is determined entirely by the position of the bar, it is possible to change the angle of the lever merely by fastening the bar around in another position. In most cases, and especially for those turret lathes where the carriage passes the headstock and the front of the machine is taken up with control levers, the chuck is furnished with the bar fastened so as to throw in the lever about a vertical position. This, however, is entirely optional, and can be furnished in any other position that may be specified.

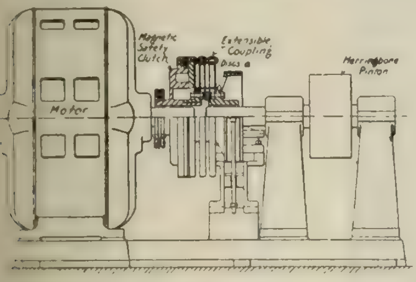
EXTENSIBLE COUPLING FOR MILL DRIVES.

THE Cutler-Hammer Clutch Co., Milwaukee, Wis., has developed a new type of coupling for use with mill drives, particularly where herringbone gears are used. The extensibility of the coupling is independent of the amount of torque transmitted and is the same at no load as when full power is being transmitted. A certain amount of flexibility is also present in the clutch and this too is not affected by the amount of torque transmitted. The coupling was designed for use with a set of rubber calendar rolls but, it is pointed out, is capable of a number of other applications where an extensible coupling is desired. In designing this coupling three factors had to be taken into consideration. The coupling must transmit the necessary power between the motor and the herringbone driving pinion and at the same time leave the latter free to align itself with the gear with which it meshes and also not transmit any end thrust caused by the lateral motion of the driving shaft to the pinion.



EXTENSIBLE COUPLING FOR MILL DRIVES.

The construction of the coupling is simple, consisting of a number of thin disks bolted together to form the disks of the coupling. The use of thin disks was decided upon as the deflection of a thin circular plate under a given load varies inversely as the cube of the thickness. While the torque transmitted by the single disk ⅜ in. thick is the same as that transmitted by three ⅛-in. disks, the flexibility of the latter combination is nine times that of the former. In this coupling, which is 32 in. in diameter, it is stated that the correctness of this theory has been satisfactorily demonstrated, the force necessary to cause a deflection of almost 1 in. being much less than the end sliding friction in the bearings.

◆

ELECTRODE PLANT FOR SHEFFIELD

THE recent installation of a number of electric furnaces in Sheffield has led to an increased demand for electrodes, which prior to the war were bought principally in the United States, although a small number were obtained from the continent. The entire supply at present comes from the United States, but according to a consular report, steps have been taken by home firms to manufacture their own supply.

A plant is being erected by the Electrode Co. of Sheffield, which has been organized with a capital of over $200,000 for the manufacture of carbon electrodes. The promoters of this company and the majority holders of the stock are four large Sheffield firms, which have installed or have in course of installation 23 electric furnaces, with a total capacity of 90½ tons. The new company will have an output of from 3,000 to 5,000 tons of carbon electrodes per annum, which will furnish the promoters with an adequate supply of electrodes for their own furnaces, although any surplus manufactured will undoubtedly be put on the market.

◆

CANADIAN PATENTS

THE following is a list of Canadian patents recently issued through the agency of Messrs. Ridout & Maybee, 59 Yonge Street, Toronto, from whom further particulars may be obtained:—Gutta Percha & Rubber Co., tires; John R. Churchill, chassis for motor vehicles; Esther Murray, wheels for motorcycles and other vehicles; John F. Goodwin, gas water heater; R. B. Thomas and W. R. Davies, the manufacture of tin and terne plates; Herbert E. T. Haultain, apparatus for separating ores by flotation; Robert MacGilchrist, septic tank syphon; John G. Robinson, steam superheater for locomotive boilers; Gutta Percha & Rubber, flat water pail; Thomas Rigby & Nils Testrup, utilization of peat; Franklin Camfield, waggon wrench; Harry G. Akers, process of producing barium and strontium oxides; Michal Migasnick, plow; John G. Robinson, apparatus for use on locomotive or like engines fitted with steam superheaters; The Williams, Greene & Rome Co., dress shirt; James H. Lumbers, intrenching tool; Georgetown Foundry and Machinery Co., knitting machine; Albert H. Power, register for hot air heating apparatus.

TRADE INQUIRIES FROM GREAT BRITAIN

THE following inquiries relating to Canadian trade have been received by the Department of Trade and Commerce, Ottawa:

935. Wire Nails.—A Leeds firm, using annually about 500 tons of wire nails, wishes to hear from shippers of this commodity.

939. Electrical Plant and Accessories.—An Edinburgh firm is desirous of receiving quotations from Canadian manufacturers.

950. Mining and Railway Supplies.—A Johannesburg firm of thirty years' standing are prepared to take up Canadian agency in rails, all kinds, and supplies, railroad cars and coaches, locomotives, creosoted sleepers, mining machinery of every kind and supplies. Immediate correspondence is requested, as this firm is in a position to secure immediately very large orders.

990. Wolfram Ore, Molybdenite and Ferro Chrome.—A Sheffield firm of steel manufacturers makes inquiry as to Canadian producers of the above.

991. Wire Nails.—A Leeds firm is in the market for twenty tons of wire nails.

992. Engineers' Tools, Chucks, etc.—A Leeds firm of ironmongers desires to hear from Canadian manufacturers of engineers' and joiners' tools, and especially 4-inch, 6-inch and 8-inch self-centring chucks.

994. Tungsten, Molybdenum, Vanadium and Cobalt.—A Sheffield firm of steel manufacturers makes inquiry for Canadian producers of the above in the refined state.

995. Steel Billets and Blooms.—A Sheffield firm wishes to receive quotations from Canadian firms in a position to export the above.

1014. Mining Equipment.—A firm of importers of mining equipment in Cape Town, South Africa, having close connections with many of the South African mining companies, ask tenders from Canadian manufacturers for the following supplies: (a) For a gold mining company, machine-cut gears, cast steel, spur and pinion; quote weights and prices. (b) For a coal company, 300 steel trucks and 325 sets of wheels; one hundred tons 16-pound section rails with 3-inch centre holes for fish plates for 150 tons of rails and sufficient bolts for 200 tons; two tons of dog spikes for fastening rails to wooden sleepers. (c) A mine roller, 20 inches by 5 inches; the number of rollers and bearings required, 300. Blue prints have been forwarded to the Commercial Intelligence Branch, Department of Trade and Commerce, Ottawa.

1034. Siemen's Steel Billets.—A Sheffield firm, who are regular buyers of Siemen's steel billets, wishes to hear from Canadian exporters.

COAL SCARCITY IN CANADA

THE scarcity of certain varieties of coal continues to be a matter of first importance, not only in regard to the supplies available for shipping, but relative to the requirements of manufacturing establishments as well. That there will be no coal in the country by March 15, 1917, is the forecast of one official. The Dominion Coal Co. reported some time ago that it was bunkering large supplies of coal for use on Government transports in anticipation of an acute famine on the St. Lawrence route, and recent developments in widely separated quarters continue to emphasize the seriousness of the situation in its every aspect.

In Eastern Canada, manufacturing and power plant institutions are very largely dependent for the supply of bituminous coal for steam raising and other purposes on the output of the mines in Cape Breton, and while at first sight the lack of available "bottoms" which is generally known to exist contributes in part to the decreased and decreasing receipts by consumers, other influences have been and are at work, the effects of which are still more far-reaching. In a word, production has been declining each month during the present year; shortage of men is the sole reason for the falling production, and enlistment for overseas service may be accepted as the sole reason for the labor shortage. During the year 1915, from January 1, until September 30, the output of the Dominion Coal Co. collieries at Cape Breton showed a steady increase from 287,000 tons in the former month to 452,000 tons in the latter month, or a grand total for the nine months of that year of 3,666,000 tons. In January of the present year the output amounted to 407,000, this total being maintained very approximately up until the end of March. In April the output fell to 378,000 tons rallying slightly in May to 383,000 tons since when there has been a steady decrease, the figures for September being around 345,000 tons. Should the rate of decrease continue, and there is little hope of its being arrested, the output for this year will show a falling off of probably three-quarters of a million tons.

In conversation with a gentleman in close touch with coal production elsewhere as well as here in Canada, we learn that instead of a decreased output being allowed to materialize abroad, special efforts have been put forth to intensify production, the various Governments concerned realizing as Canada's has not, that coal and especially bituminous coal is the basic munition in the war in which we are engaged. As if, however, ill-directed enlistment had not been sufficiently effective to restrict production, we understand that some 1,800 men left the Maritime Provinces in August to harvest in the West, the half of whom were taken from the mines and munition plants of Nova Scotia. A majority, if not all of those men were carried all or part of the way West on our Government Railroad, and of course at a low and attractive rate. Taken in conjunction with the lack of regulation of enlistments, it is plainly evident that the importance of coal for our manufacturing and power plant requirements is still unrealized by responsible Government.

RAILROAD PUBLICITY

A WEEK ago at the monthly meeting of the Canadian Railway Club, Montreal, the subject of Railroad Publicity was discussed in a paper by Walter Thompson, of the Grand Trunk Railway System Press Bureau. In common with most of us, Mr. Thompson believes that railroad "baiting" is on the wane—everywhere we might add; in any case so far as Canadian railways are concerned it has not to our knowledge, or from observation, at any time assumed ugly proportions and been over-menacing in attitude. Railroad "baiting," however, and wherever practised, has of course nothing to commend it, and in the ultimate analysis is usually barren of result; nevertheless, whether extreme or moderate of display, it may be averred that railroad executives in the past stuck too tenaciously to their "perch" of silence and indifference.

The establishment of publicity bureaux and the gradual development of the work and scope of these has broken down the wall of public prejudice against railroad administration and operation, while that offspring of the publicity department—the Employees Magazine, has contributed a full measure to the success achieved. No auxiliary of railroading, or for that matter, of any other business enterprise whose activities call for great plants and great numbers of employees, makes bid for the like quality and quantity results as regards co-operative service. Everything that transpires is departmentally allocated a place in the editorial columns each month, and as a result the individual interest becomes merged in that of the institution as a whole. It may not be assuming too much to observe that, in addition to the inside benefits which have been procured by keeping executives and employees in close touch by means of the Magazine, the latter in the hands of the employees has borne a large part in breaking down and removing almost entirely preexistent public prejudice, particularly in the sphere of railroading.

In the course of the paper, reference was made to the reticence of executives regarding the work of the "road," and the opinion was expressed that a desirable publicity would be of considerable inherent value. To quote the author, "you may create a publicity department with all the literary and journalistic genius of the age, but if it has not the full co-operation of all officers of the road; if they are not keenly interested in its activities, and willing to render it ready support, it will fail to do good work. Keep the publicity end of the road in view every day for ways in which it may assist your department and the service as a whole." That there is room for a keener interest in and still more ready support to even the best organized and directed railroad publicity departments by executives individually and collectively, goes without saying, for here as in every other sphere of industrial and commercial enterprise, the need is a daily development and growth.

INDUSTRIAL NOTABILITIES

CHARLES GORDON McGHIE, manager and secretary, Welland Vale Co., manufacturers of hand agricultural implements, special forgings and edge tools, St. Catharines, Ont.; director, Canadian Crocker-Wheeler Co.; vice-president, Metal Drawing Co.; vice-president, Wallingford Mfg. Co., Wallingford, Vt.; president, Bedford Mfg. Co., Bedford, Que., also interested in many other Companies, was born at St. Catharines, Feb. 16, 1868, son of the late William and Christina (Gillespie) McGhie, of Scottish ancestry. He was educated in Public Schools and Collegiate, St. Catharines, and began his business career as office boy with Whitman & Barnes, St. Catharines. During the period from 1881-88 he was successively clerk and bookkeeper; traveling salesman, 1888-1890; traveling salesman, Welland Vale, 1890-1895; traveling salesman, Whitman & Barnes, 1895-1900; special representative to Australia for Welland Vale Mfg. Co., 1900-1901; Eastern representative for the Welland Vale Co., and president of the Bedford Company, Montreal, 1901-1904; bought out the J. H. Wethey Co., St. Catharines, 1904-1905; has been secretary and office manager, Welland Vale Co. since 1905.

CHARLES GORDON McGHIE.

Mr. McGhie has been a member of Water Commission, St. Catharines, for the past eight years, and was largely instrumental in building a larger water-main service, thereby greatly increasing water supply. He devoted much of his time and effort to building up the export trade of the Welland Vale Co., which is considerably larger now than the home trade; one of the organizers of the Metal Drawing Co., munition manufacturers in St. Catharines. As an industrial worker for St. Catharines he has succeeded in locating different industries there. He is a member of finance committee of the Patriotic Fund, and takes an active interest in patriotic work.

Mr. McGhie married Harriet Junkin, daughter of Alexander Junkin, Nov. 12, 1890; the family consisting of two sons and one daughter. His clubs are: St. Catharines; Niagara (New York); Albany (Toronto); his society, A.F.&A.M.; his recreations, golf, lawn bowling, motoring. In politics he is conservative, and in religion, Anglican. His residence is 151 Ontario St., St. Catharines, Ont.

The General Market Conditions and Tendencies

This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents.

Montreal, Que., Oct. 16, 1916.—The industrial situation has apparently reached another stage in its history as indicated by the further price increases on many lines of steel and metal products. To say that the summit will soon be reached, only adds another to the prophecies that have been advanced at various periods in the past, only to be exploded by subsequent developments. That the apex has however been reached in some directions is shown in the slackening off of certain enterprises involving the use of steel for domestic purposes until lower prices prevail. The higher prices may as a consequence place additional facilities at the disposal of shell steel producers.

Pig Iron

The market in pig iron has taken on additional strength, this being indicated by a general advance of from 25 cents to $1 per ton. While no change has been made in local circles, an advance here is expected.

Steel

No cessation appears evident in the upward movement of steel and steel products. The continued advances that mark the trend of the ever increasing volume of business may result in the curtailment in certain lines of domestic activity, until a lower level is again reached. That the present conditions will prevail for some time is not only probable, but it is more than likely that further advances will feature the market in the near future. Railroads and structural engineers are demanding increased tonnage. The volume of business being placed by railroads for steel rails is very large, but, owing to the condition of the mills, delivery on some of the orders run into 1918. In many respects the situation in plates is under greater tension than at any previous period. Added to the call from railroads and shipbuilders, the export demand is of such a volume as to cause uneasiness in these circles, and to some extent a partial famine is anticipated. While no general advance is reported, it is believed that offers have been made involving premiums on current quotations. The sheet situation has experienced another adjustment in prices, and as was expected, is an advance on previous quotations. Black and blue annealed sheets, Pittsburg, have been advanced $5 per ton the former being quoted at $3.50 and the latter at $3.35 per hundred pounds. The price on galvanized sheets is now $4.50 Pittsburg, being an advance of $2 per ton. An additional $1 per ton has been placed on the Pittsburg quotation for iron bars, the current price ranging from $2.70 to $2.75 per hundred pounds. Recent demand has been quite heavy. The consumption of wire and wire products is still very large, and a revision of prices is expected shortly. Steel hoops have been affected by the recent advance, the quotation of $3.25 Pittsburg, representing an advance of $5 per ton. Wrought iron pipe, and also boiler tubes are still in good demand. Furnace coke for immediate delivery is now $4.50 per ton, an advance of 50 cents per ton.

Metals

The general situation in metals is comparatively unchanged. Copper is very firm with prospect of further heavy buying. Tin is becoming easier after the scare of last week. Spelter continues dull, and lead is quiet but firm. Antimony and aluminum are a little stronger.

Copper.—In comparison with recent developments, the copper market is quiet, although considerable interest is still being shown and some good inquiries are reported. The consumption of this metal is very heavy at the present time, both for domestic and war purposes. Copper is being used in such enormous quantities just now, that the fear is prevalent that the production will be insufficient to cover the future requirements of the trade. If consumers should be confronted with a situation of this nature, it is more than possible that higher prices would prevail. However, both smelters and refiners are steadily increasing their facilities, in order to cope with the abnormal demand, and unless exceptional pressure is placed upon the producers, the situation will not likely develop any serious features. The recently placed order for the Allied Governments for about 250,000 tons of copper, is reported to be insufficient for intended requirements, and it is possible that further tonnage will be booked shortly. The London market is strong having advanced £3 on spot and £2 on futures. The local situation continues steady with prices very firm, lake and electrolytic 31c and castings 30c per pound.

Tin.—Developments of submarine activities during the earlier part of last week was the cause of a sharp advance in tin, which followed in the wake of a highly excited market. However, like many a previous scare, the uneasiness was only temporary, the situation having become easier and quotations gradually resuming their former level. While heavy sales are not reported, it is believed that considerable business is being done in a quiet way, more especially for early futures. Local dealers were not much affected by the recent activities, quotations being firm and slightly stronger, this week's quotation showing an advance of ½c, the price being 44½ cents per pound.

Spelter.—It is apparently impossible to break the dullness of the spelter situation. The stronger tendency that seemed to be developing, has been replaced by a contrary tone that reflects itself in lower prices. The actual condition of the market is difficult to determine, as the larger interests are not actively in the market, and present quotations are based on visible activities. The dullness is partly accounted for by the large volume of high grade scrap on the market, which the brass mills are absorbing. The London situation has shown a little improvement and prices have advanced from £2 on spot to £2½ on futures, but the New York market has declined ⅛ cent, the current quotation being the nominal price of 10c per pound. Dealers here report a quiet market, with an undertone of weakness, but prices are steady at 13c per pound.

Lead.—Nothing has developed to change the general tone of the market, firm price quotations being maintained. Production is still equal to consumption, but the market activity is not pronounced, and neither producers or consumers are showing much interest in the situation. Under these circumstances, prices are well maintained; the Trust quotation being 7c, and the independents asking from 7 to 7⅛c. The London market is firm and higher, while the local market is steady with quotations unchanged at 9c per pound.

Antimony.—Owing to the activity in bonded metal, the market in antimony has taken on a little strength, resulting in advances on listed quotations. Local dealers are quoting last week's price of 15c per pound.

Aluminum.—New York reports an advance of 4c per pound on No. 1 Virgin, following increased market activity. The situation here is firm with prices unchanged at 70c per pound.

Machine Tools and Supplies

While the demand for machine tools continues steady, the requirements are not such as they would be were more labor available. Manufacturers are experiencing some difficulty in keeping the machines now installed in operation, and until more help is available the calls for additional equipment will probably decrease. However, the volume of business is still satisfactory and inquiries for domestic purposes promises well for the future. Supplies of all kinds are in good demand; deliveries in some cases being extended to the discomfiture of the consumer.

Scrap

The situation as regards old materials is following the lead of steel, quotations for scrap materials showing advances on the American market which will likely be reflected here shortly. At present dealers are asking last week's prices.

Toronto, Ont., Oct. 17.—Although shell plants are still many months behind on deliveries, considerable improvement is looked for in the future, as the Imperial Munitions Board announced recently that the supply of steel and forgings was more satisfactory and no interruptions in output are likely to take place on this account. A number of new plants are now ready to turn out the larger shells. The new order for munitions to the value of $60,000,000 will stimulate the industry and incidentally brings the total of orders placed this year up to $185,000,000.

The principal feature in the industrial world as it affects the machinery and steel trades is the steady advance in prices of raw materials. At the present time there appears to be no limit to the upward movement in prices. The scarcity of steel is becoming a serious matter, and the situation is becoming more acute as time passes. Consumers are confronted with a difficult problem, having to wait at least twelve months for delivery, which is a serious handicap to business.

Enlarged Canadian Trade Intelligence Service

Under the arrangement made by the Minister of Trade and Commerce with Sir Edward Grey in July, 1912, the Department is able to present the following list of the more important British Consulates whose officers have been instructed by the Foreign Office to answer inquiries from and give information to Canadians who wish to consult them in reference to trade matters.

BRAZIL
Bahia, British Consul.
Rio de Janeiro, British Consul General.

CHILE
Valparaiso, British Consul General.

COLOMBIA
Bagota, British Consul General.

ECUADOR
Quito, British Consul General.

EGYPT
Alexandria, British Consul General.

FRANCE
Havre, British Consul General.
Marseilles, British Consul General.

INDIA
Calcutta, Director General of Commercial Intelligence.

ITALY
Genoa, British Consul General.
Milan, British Consul.

MEXICO
Mexico, British Consul General.

NETHERLANDS
Amsterdam, British Consul.

PANAMA
Colon, British Consul.
Panama, British Vice-Consul.

PERU
Lima, British Vice-Consul.

PORTUGAL
Lisbon, British Consul.

RUSSIA
Moscow, British Consul General.
Petrograd, British Consul.
Vladivostock, British Consul.
Odessa, British Consul General.

SPAIN
Barcelona, British Consul General.
Madrid, British Consul.

SWEDEN
Stockholm, British Consul.

SWITZERLAND
Geneva, British Consul.

URUGUAY
Monte Video, British Vice-Consul.

VENEZUELA
Caracas, British Vice-Consul.

particularly to those using steel in the manufacture of their product.

Steel

The situation in the steel market is getting tighter and the upward movement in prices continues without any sign of a reaction. The steel market was never stronger and deliveries never so backward, the first quarter of 1918 being named in some cases as the best delivery that can be made. In fact, buying of bars, plates and shapes, and steel products generally, for delivery in 1918, is the outstanding feature of the steel situation. During the week prices on steel bars were withdrawn by some mills, being followed later by an advance of 10c on both iron and steel bars. Iron bars are now quoted at $3.35, and steel bars at $3.50 per 100 lbs. Cut nails have advanced 30c, and are now quoted at $3.75 per 100 lbs. base, while pressed steel spikes are higher at $4.10 per 100 lbs. base. The expected advance on boiler tubes has materialized; lapwelded tubes, however, only are affected. The advance is equal to $3 per 100 feet, and is due to the big demand for tubes and the sold-up condition of the mills. Several of the largest are not taking orders for delivery before the second and third quarters of 1917. The situation in plates is getting tighter, and a famine exists in the primary market. Not only is the export demand heavy, but there is also an enormous demand from shipbuilders for plates. An advance in prices of plates is looked for in the near future.

The high-speed tool steel situation shows little or no improvement, as the increase in output is offset by the increased demand. A few months ago the market was easier, but recently has become considerably firmer. The importations from England are insignificant owing to the big demand in Great Britain from munition plants, and also from France and Russia. The demand is so pressing that high-speed steel scrap is carefully collected for remelting to minimize loss as much as possible. While the production of tungsten has considerably increased, available supplies are quickly absorbed by the steel makers. A fair amount of high-speed tool steel is coming in from the States, but not in sufficient quantities to meet the increasing demand.

The sheet market is very firm, following the higher prices recently announced by the American Sheet & Tin Plate Co. at Pittsburgh. The new prices are $2 per ton higher on galvanized sheets and $5 a ton higher on blue annealed and black. The new prices are as follows:—Blue annealed, $3.25; black, $3.40; and galvanized, $4.50. These prices are for Bessemer, open-hearth being $2 a ton higher. Local prices are consequently very firm, and will likely advance in sympathy with the United States market.

The United States Steel Corporation statement for September showed a decrease of 137,733 net tons in unfilled orders on its books, the total orders amounting to 9,522,584 tons. This does not mean that the demand for steel has slackened, as practically all the mills in the United States have been declining large volumes of new business during recent months. It has been stated that the U. S. Steel Corporation has enough business on its books to guarantee steady operation for the next eight months even if it fails to book another ton. The demand for steel in the United States is more pronounced than a month ago, and the market is very strong, with prices advancing. The shortage in supply of sheet bars and billets is getting more acute and prices are higher. Export business is still heavy, but the domestic demand has assumed considerable proportions, particularly as regards rails and plates, the demand for the latter being very heavy. There is a great scarcity of billets and sheet bars, and prices are very firm, with an upward tendency. Steel bars are being quoted at 2.75c, plates 4c, and shapes 2.75c Pittsburgh; delivery at mill convenience.

CANADIAN GOVERNMENT PURCHASING COMMISSION

The following gentlemen constitute the Commission appointed to make all purchases under the Dominion $100,000,000 war appropriation:—George F. Galt, Winnipeg; Hormidas Laporte, Montreal; A. E. Kemp, Toronto. Thomas Hilliard is secretary, and the Commission headquarters are at Ottawa.

Pig Iron

The continued strength in the pig iron market in the U. S. is reflected locally, and prices on domestic pig irons have advanced $1.50 per ton. The advance is somewhat belated, and is due principally to higher prices in the States. The sharp advances in the pig iron market in the States are taken to indicate that Lake Superior iron ore prices next year will be higher. Coke also is advancing. Hamilton and Victoria brands are now quoted at $25.50 per ton. Gray forge, Pittsburgh, has advanced again, and is now quoted at $20.45 per ton. Lake Superior charcoal iron is also higher at $20.75 per ton, Chicago. Bessemer is now $23.95, and basic, valley furnace, $20 per ton.

Scrap

With the exception of wrought and cast iron scrap, the market is strong and prices firm. The situation as regards steel turnings has improved, as the Dominion Government has given permission for limited quantities to be exported. Hitherto this material has been accumulating, there being practically no market for it in Canada, as sufficient steel scrap, such as heavy melting, has been available, and is preferred by the mills. The only important change in prices to note is an advance of 1c per pound in light copper.

Machine Tools

The statement issued by the Imperial Munitions Board that the difficulty of obtaining forgings has been overcome will improve the situation in the machine tool business. Increased activity may also be expected following the placing of contracts covered by the new order for munitions to the value of $60,000,000. This, it is believed, will be principally for shells of large calibre.

Supplies

Prices of machine shop supplies continue to advance, due to the steady increase in cost of raw materials, particularly iron, steel and brass. Wood pulleys have advanced 10 per cent., the discount which was 50 per cent. being now 40 and 10 per cent. All lathe and drill chuck lists have been cancelled pending the announcement of higher prices. A new and standard list is being prepared covering all lines of chucks which will be subject to standard discounts. A new discount of 35 per cent. has been issued on black rivets and burrs. Stove bolts now carry a discount of 60 per cent.; machine bolts, ⅜ in. and less, 30 per cent.; machine bolts, 7-16 in. and larger, 20 per cent. A new discount of 65 and 5 per cent. has been announced on practically all makes of files except Nicholson, which is unchanged at 55 per cent. Linseed oil is stronger, and quotations are higher at $1 for raw, and $1.03 for boiled oil. Turpentine is weaker, but unchanged at 71c per gallon.

Metals

A quieter tone characterizes the metal markets this week, but prices have been well maintained, with the exception of tin, which has declined, the market having recovered from the excitement caused by the recent submarine activity. The copper market is still very strong, and is in an excellent position, with quotations unchanged. Lead and spelter are quieter, but antimony is firmer on better demand. Business locally continues good, and the outlook generally is favorable.

Copper.—The strength in copper continues undiminished, producers reporting that while the volume of business is gradually tapering off, fair orders are still being taken from domestic consumers. The Italian Government has come into the market for about one million pounds of copper. Owing to the enormous demand for copper, there is some fear of a shortage, and higher prices may yet be recorded. Local quotations are firm and unchanged at 31c per pound.

Tin.—The submarine scare having quickly subsided, the tin market recovered, although it is still irregular on prompt metal. The market, however, is firm and higher on futures. Tin has declined 1c locally, and is quoted at 46c per pound.

Spelter.—The market is dull, with little business passing. There is considerable uncertainty in the market, and the large interests are waiting until the situation clears before coming into the market. Local price is 14c per pound.

Lead.—Business is quiet in the lead market, as neither buyers nor sellers are showing much inclination to do business. The Trust is maintaining the price of lead at 7c, New York. Local price, 9c per pound.

Antimony.—Quotations are nominal and unchanged, although the market is firmer and demand heavier. Local quotation is 18c per pound.

Aluminum.—The market is more active, but quotations are unchanged at 68c per pound.

◆

U. S. COPPER EXPORTS

IN view of the large orders for copper placed in the United States by the Allies during the past few days, the following figures showing the exports for eight months ending August 31st last, in tons of 2,240 pounds, are significant:

	1916.	1915.
United Kingdom	51,738	57,015
France	105,398	62,592
Germany	......	......
Holland	1,912	798
Belgium	......	......
Austria	......	......
Italy	31,143	27,916
Denmark	1,904	1,550
Norway and Sweden	8,101	11,586
Russia	12,283	8,651
China and Japan ...	71	81
Sundries	2,654	1,597
Total	215,199	171,786

TRADE OPPORTUNITIES IN THE WEST INDIES

JAMES E. DOBBS, who as a representative of the Canada India League, spent ten weeks in the British West Indies and in Trinidad in particular, has returned to Toronto firmly convinced that there are vast opportunities for the development of Canadian trade in the West Indies. There is there, Mr. Dobbs declares, a prevailing opinion that almost all sorts of Canadian products can find a ready market if advertised and sold by competent representatives who would see that the goods were prepared and packed to suit tropical conditions. The Canada India League is interested in bringing about a closer bond of sympathy among the colonies of the Empire and eliminating any social, religious or racial prejudices which might exist, and Mr. Dobbs spent considerable time in Trinidad, where men from the East Indies form one-third of the population, in studying the social, commercial and domestic life of the men from the East Indies.

CANADIAN COMMERCIAL INTELLIGENCE SERVICE

The Department of Trade and Commerce invites correspondence from Canadian exporters or importers upon all trade matters. Canadian Trade Commissioners and Commercial Agents should be kept supplied with catalogues, price lists, discount rates, etc., and the names and addresses of trade representatives by Canadian exporters. Catalogues should state whether prices are at factory point, f.o.b. at port of shipment, or, which is preferable, c.i.f. at foreign port.

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News

Engineering

Rainy River, Ont.—Blackmore Bros. will build a machine shop to cost about $15,000.

Merrickville, Ont.—The Percival Plow & Stove Co. plant was destroyed by fire recently.

Toronto, Ont.—The Hamilton Gear & Machine Co. will build an extension to their plant to cost about $5,000.

Renfrew, Ont.—Imbleau & Sons propose building a foundry and machine shop, which will cost about $3,000.

Alton, Ont.—The Alton Foundry Co. is in the market for 3-phase, 60-cycle, 220-volt motors of 5, 10, 15 and 25 h.p.

Glenora, Ont.—J. C. Wilson & Co. have purchased a site for a new machine shop, which will be of brick construction. The building will cost approximately $15,000. Some new machine tools and shop equipment will be required.

Merritt, B.C.—Over 175 tons of fabricated steel are required for the new addition to the leaching building of the Consolidated Co. electrolytic zinc plant at Trail. The new building is 165 x 200 feet, and the work of erection is well under way.

Steveston, B.C.—The rolling mills in the old Dominion Safe Works, at Bridgeport, which were burned to the ground about a month ago, have been opened again in a temporary way, but arrangements are under way for the re-building of the structure.

Amherstburg, Ont. — A Canadian branch of the Solvay Process Co. of Syracuse, N.Y., is about to be established at Amherstburg. The plant, it is said, will be erected near the Limestone quarries, Anderson Township, to supply all Canadian territory in soda ash. Reports from Syracuse state that an issue of $300,000 of stock has been made to provide funds for building and equipping the new plant.

Hamilton, Ont.—The Hamilton Steel Wheel Co. has purchased a site, and will erect a plant, costing $200,000, for making steel wheels, which product was formerly furnished by Germany and the United States. This industry will give employment to about two hundred men, and will turn out about seventy-five tons of steel wheels per day. C. W. Sherman, of the Dominion Steel Foundry Co., will be managing director of the new concern.

Ottawa, Ont.—The aeroplane factory to be established in Canada, probably in Toronto, will cost, it is reported, approximately a million dollars, and will be equipped to turn out six machines per week. These machines, as stated previously, will be purchased by the Imperial Government. The supervision of all matters connected with the establishment of the factory will probably be entrusted to C. S. Wilcox, of Hamilton, chairman of the Steel Company of Canada.

Vancouver, B.C.—The P. G. E. R. is about to commence erection of machine shops, store buildings, scales, etc., at Squamish. The new construction is to be strictly modern, and will cost approximately $100,000. At East Lillooet also, 120 miles above Squamish, and selected as the railway divisional point, immediate construction of round-house and divisional headquarters buildings will be commenced, this work to cost $50,000. A. H. Sperry is general manager of the railway company.

Electrical

Dublin Township, Ont.—The Township Council will shortly submit a by-law to authorize the installation of a hydro system.

Woburn, Ont.—A petition, signed by over 400 ratepayers, has been presented to the Township Council asking for the installation of the hydro-electric system. The petition has been referred to the Hydro-Electric Commission for approval.

General Industrial

Montreal, Que.—The Thomas Davidson Mfg. Co. will build an extension to their factory here.

Montreal, Que.—Fire at the Gagnon Co. boot and shoe factory recently did damage to the extent of $200,000.

Quebec, Ont. — Arrangements have been made whereby the Dominion Fibre Co. of Doon, whose premises there were burned out about two months ago, will locate in Guelph, taking over the old Grundy stove foundry near Grow's Bridge.

Steveston, B.C.—R. D. Rorison interviewed the council recently, asking for free water and exemption from taxation for an industry which will employ a large number of men and occupy at least 400 acres of land. No action was taken by the council, but it is expected that more definite proposals will be made in a few days.

Victoria, B.C.—The re-establishment on a much larger scale of the industry formerly carried on by the Sidney Cannery will shortly be undertaken by the Sidney Cannery Co., a new concern which has been incorporated to take over the business. Messrs. Charles F. Gooderich and H. E. Sims, of Port Angeles, men prominent in the cannery industry on this coast, and who will invest a considerable amount of capital in the new concern, are the prime movers in the scheme. The company is capitalized at $40,000. They contemplate adding extensively to the plant at Sidney, and will install modern machinery.

Trade Gossip

The Berlin Rubber Mfg. Co., have changed the name of the concern to that of the Kitchener Rubber Mfg. Co.

Fernie, B.C.—The Rambler-Cariboo Mining Co. has contracted with a United States refining concern to take over 800 to 1,000 tons of zinc now held for treatment at that mine.

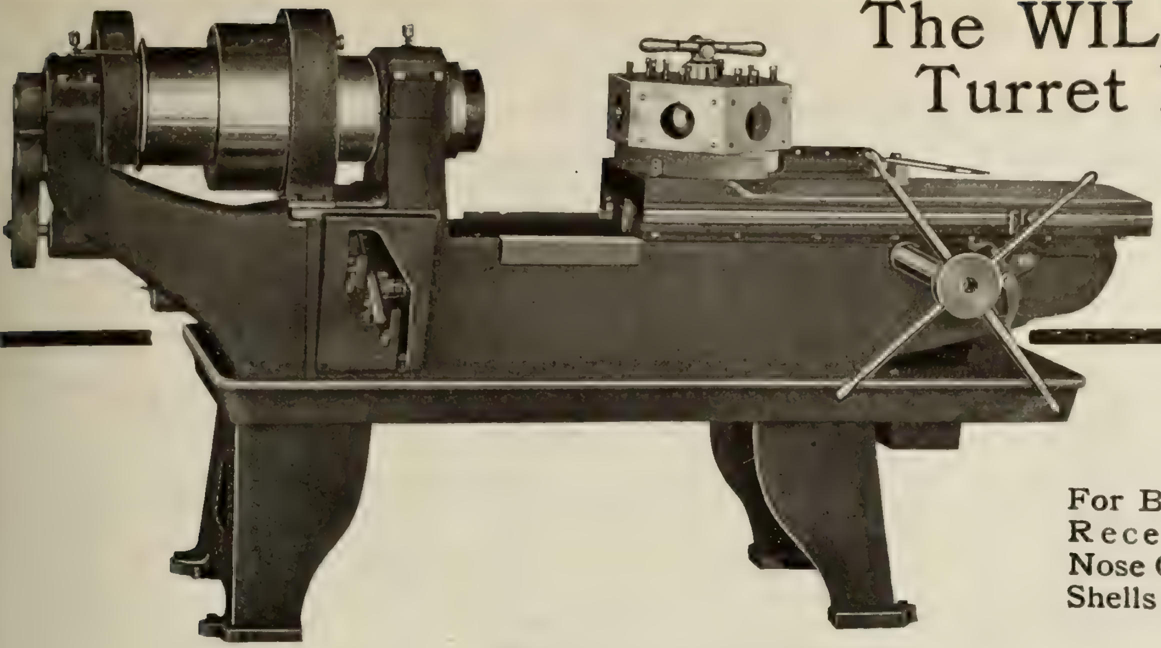
Kingston, Ont.—The feldspar industry is booming in Frontenac. Four comcompanies are now exporting the mineral and a fifth company will shortly be at work. The total value of the feldspar exported from Frontenac will be over $100,000, or twice as much as last year.

The Boss Lock Nut Co., have recently been incorporated in Canada to manufacture lock nuts for railway, constructional and industrial use. T. W. Coleman formerly manager of the Grip Nut Co., is now manager of the new concern with offices at 901 Eastern Townships Bank Bldg., Montreal.

The Canadian Fairbanks-Morse Co., have opened a branch sales office at Windsor, Ont., in order to take care of their increasing business in Western Ontario. J. N. Charles will be in charge of the office.

British Import Prohibitions.—A proclamation of October 3 provides that the

The WILLIAMS Turret Lathe



Prompt
Delivery

For Boring, Base Recessing and Nose Operation on Shells up to 6 in.

——SPECIAL FEATURES——

- 2-Step Cone for 6" Belt.
- Hole in spindle bored large enough to take 6" shell.
- Extra large spindle bearings.
- Can be equipped with 3-jaw Universal or Air Chuck.
- Long and Heavy Turret Slide, well gibbed.
- Extra Large Turret ensures rigidity under heavy cuts.
- Powerful indexing arrangement with automatic trip.
- Four instantaneous Feeds.
- Weight about 7,000 lbs.
- No Friction devices are used. Countershaft is equipped with Tight and Loose Pulleys.
- Write for full description and prices.

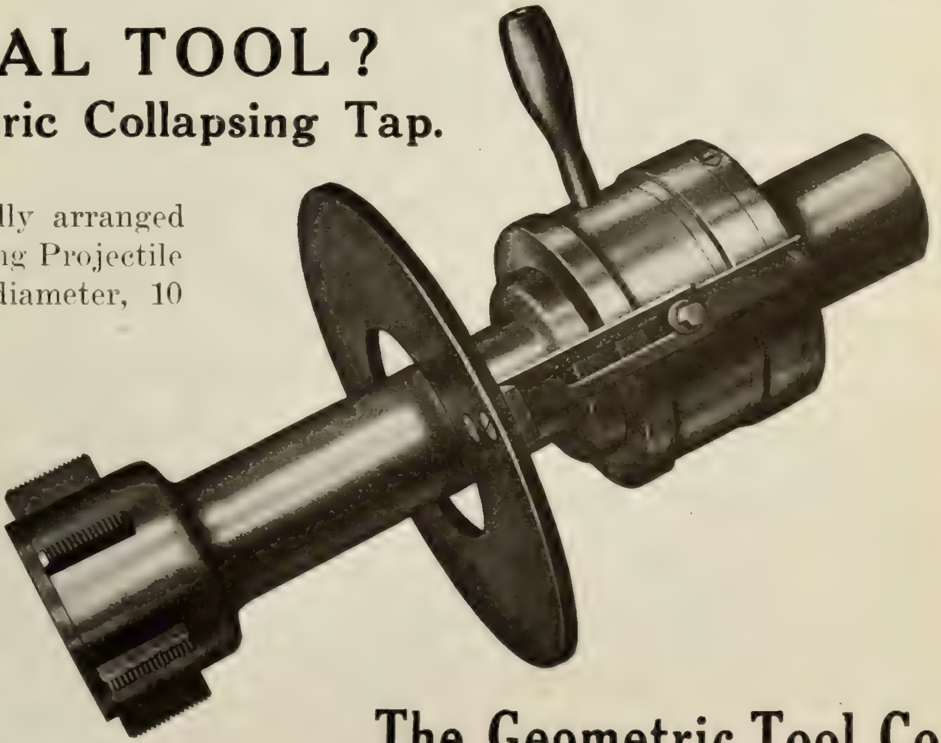
64-66 Front
Street W.

The A.R. WILLIAMS Machinery Co., Limited

Toronto,
Canada

AN UNUSUAL TOOL?

No. It is a Geometric Collapsing Tap.



Only one of the many specially arranged Geometrics. This Tap is tapping Projectile Caps a foot deep, 5.378-in. diameter, 10 pitch.

Geometric Collapsing Taps are arranged for all classes of thread tapping above $^3/_4$-in. diameter. Rigid while tapping, but collapse the chasers when the required depth is reached.

Can be fitted for Screw Machine or Turret Lathe, also to live spindle, such as Drill Press.

Get acquainted through our catalogue.

The Geometric Tool Co.
New Haven, Conn., U.S.A.

Canadian Agents:
Williams & Wilson, Ltd., Montreal. The A.R. Williams Mchy Co., Ltd., Toronto, Winnipeg, St. John, N. B.

following articles will be treated as absolute contraband in addition to those set out in royal proclamations:—Insulating materials, raw and manufactured; fatty acids; cadmium, cadmium alloys, and cadmium ore; albumen, aluminum powder, bone, horn, ivory, and celluloid.

Increase in Building Ships.—An announcement from London states that a substantial increase in merchant shipping under construction for the three months ending October 1 is reported by Lloyds. The report shows that on Oct. 1 there were 469 vessels building, representing a total of 1,789,054 tons. This represents about 249,000 tons more than the amount under construction at the end of the previous quarter, and 253,000 tons more than that building a year ago.

To Capture Russian Trade.—A. Melville Dollar, of the Dollar Steamship Line, with offices in Vancouver, B.C., is of the opinion that that city should take similar steps along the line that Seattle is doing to capture the Russian trade. Seattle has formed a $2,000,000 corporation to go after this trade, and Mr. Dollar is of the opinion that the best way for Vancouver to go after this trade is to form a corporation also. Vancouver has as good a chance of getting the trade as Seattle, he says.

The Tungsten Market.—The tungsten market is more active in the U.S. Large sales of concentrates for next year's delivery have been made at about $17 per unit for 60 per cent. ore. At least 200 tons of ferrotungsten has also been sold, part of it for foreign consumption, England being the principal purchaser. The price paid was $2.60 to $2.75 per lb., New York, of contained tungsten. An incident connected with England's purchase is that one lot was taken from an American producer whose name appears on the British supplementary black list.

The British Columbia Copper Co., of Greenwood, B.C., will discontinue the shipment of copper across the border after the 1st of November, the Consolidated Mining & Smelting Co. having contracted to handle the entire copper product of that company. This latter company have just completed an electrolytic plant which will have a capacity of from five to ten tons of the red metal daily, and their facilities for handling zinc concentrates will soon enable them to take care of the larger part of the product of the zinc mines of the Kootenay-Boundary district.

Marine Motors in China.—While there are at present perhaps not more than a dozen marine motors in the vicinity of Amoy, this should become a good market for marine motors and sundry supplies, as the Chinese are becoming more and more acquainted with the use of motors and the great advantage derived through them. At present practically all of the local traffic is carried by sailing boats, which is both slow and expensive. If the benefits of marine motors were properly displayed, say by a demonstration agent, and a local agency opened, good results would undoubtedly follow.

B. C. Producing Copper.—The electrolytic copper refinery at Trail, B.C., which has now been in operation for a few weeks, will shortly begin the shipment of electrolytic copper. The melting building—where the copper sheets as taken from the tanks are melted into shipping shape—is now completed, and the reverberatory furnace in which the melting will be done is almost ready. After that the plant will begin turning out and shipping pure copper at the rate of some five tons daily—the first product of its kind in Canada. The capacity of the plant, according to Superintendent John F. Miller, who also has charge of the electrolytic lead refinery, is ten tons daily.

Britain First in Coal.—Germany even in war time is producing considerably more iron and steel than the United Kingdom, and the territories she has seized are no doubt being used to augment her supplies. The following is a comparative table:—

Pig Iron:	1913	1915.
United Kingdom	10,479,000	8,793,000
Germany	19,291,000	11,789,000
Steel:		
United Kingdom	7,663,000	8,550,000
Germany	18,958,000	13,258,000

In coal, Britain continues to hold the first place in Europe by a long lead, though the production in 1915—253,179,000 tons—showed a substantial drop from the 1913 figure—287,411,000 tons.

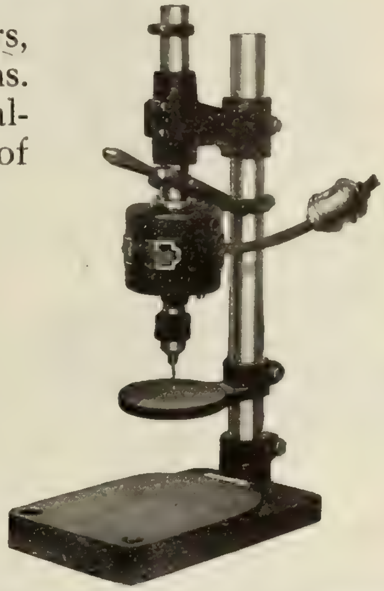
Exemption of Gold Mining Machinery.—A Russian Imperial Decree has been issued exempting from duty for a period of ten years the following machinery and apparatus for use in gold mining:—Dredges and excavators and parts thereof; apparatus for grinding gold-bearing ore or for the chemical extraction of gold from ore and prospecting apparatus, together with parts thereof. The latter are entitled to free admission, whether or not imported at the same time as the principal article. The measure is retroactive, providing that all duties collected on such machinery and apparatus since January 1, 1916, shall be refunded. This concession is a restoration of an exemption which was in effect prior to January, 1909.

B. C. Mineral Exports.—The total exports of copper from the Fernie district during the first nine months of this year amounted to 4,741,861 pounds, valued at $1,320,468. Gold, for the last quarter, made a total export of 7,094 ounces, valued at $171,329. The value of silver exports for the same time was $52,664; zinc to the value of $160,074; and lead valued at $1,042, were sent over the line. Timber products to the value of $97,692 were exported. Included in the timber products was 1,178,400 feet of white pine lumber, sent to a large match manufacturing concern in the United States for use in the manufacture of matches. Coal and coke to the value of $305,455 go to make up the total.

Newcastle, N.B.—A deal is reported to be near completion between the Partington Pulp & Paper Co. in New Brunswick and leading capitalists in Maine. It is said that more than one million dollars capital will be put into the proposition. Included amongst the capitalists who are interested is Hugh Chisholm, of Portland, Me., who is intimately connected with the International Pulp & Paper Co. The property under consideration is said to include mills at St. John, Marysville and Blackville, and timber limits on the Nashwaak and other streams. It is not at all improbable that a larger pulp mill will be built at Blackville. N. M. Jones, of St. John, is manager of the Partington Pulp & Paper Co.

U. S. Exports to Russia.—United States exports to Russia, via Vladivostok, January 1 to April 1, 1916, aggregated $31,497,280, according to the report recently of the American-Russian Chamber of Commerce at 60 Broadway, which obtained the data from the Russian-American Chamber of Commerce at Moscow. A wide variety of merchandise is included in these exports. Iron and steel and similar products aggregated approximately $8,000,000; other metal products, $3,000,000; machinery, $7,655,000; transportation supplies, $5,574,000; textiles, including raw cotton amounting to $4,365,000, and cloth and other woollen fabrics, to the amount of $1,280,000, reached a total of $5,726,000; chemicals, drugs and dyestuffs, $452,000; and leather, $982,000.

Minerals in Newfoundland.—The Government geologist estimates the iron ore deposits in Newfoundland at 3,635,500,000 tons. On Belle Isle, Conception Bay, alone, the estimated deposit of this ore is put at 35,000,000 tons, and more. The total ore mined and exported since the beginning of operations in 1895 to date is estimated at 15,000,000 tons, all of which, prior to the war, went to the United States, United Kingdom, Canada, the Netherlands, and Germany. Since the outbreak of the war none has gone to Germany, and but little to the United States, the United Kingdom, and the Netherlands. Canada has taken the major portion, much of which is being utilized for munition purposes.



Aikenhead's DUMORE SENSITIVE DRILL

is especially adapted for the use of jewelers, watchmakers, instrument manufacturers and gold and silversmiths. The Feed control which is equipped with a spring balance is extremely sensitive and the most delicate piece of work can be drilled accurately and rapidly.

Specifications :

Height—18 inches.
Weight—17 lbs.
Stroke—2 inches.
Drills to center of a six-inch piece.
Drilling capacity:
Steel, 0 to 3-32".
Brass, Aluminum and soft alloys, 0 to 13-64".

Equipped with a high speed Universal Motor which operates on either D. C. or A. C.

Speed 8,000 R. P. M.

Imported S. K. F. Ball Bearings eliminate vibration.

Catalogs on Request

Municipal

Kingsville, Ont.—The Town Council propose having improvements made to the waterworks system.

Scarborough Township.—The Township will petition the city to extend its water main service throughout the district as the need arises.

New Westminster, B.C.—Negotiations are still under way between the City Council and John R. Duncan regarding a site for an extension to the Vulcan Ironworks.

Hamilton, Ont.—Plans will be prepared for waterworks buildings and equipment, including a high-duty triple expansion steam unit and steam turbine, to cost $300,000. E. R. Gray, city engineer.

Port Hope, Ont.—The town carried the Port Hope Sanitary Mfg. Co. by-law on October 10 by a vote of 343 for and 8 against. The by-law provides exemption of taxes. The company will pay the town $650 rent per year for the land.

New Incorporations

The Exolon Co. of Thorold, Ont., makers of abrasive materials have been granted a supplementary license to carry on business in the Province of Ontario with a capital not to exceed $275,000.

The White Co., has been incorporated at Ottawa with a capital of $40,000 to manufacture motor cars and trucks with head office at Toronto. Incorporators are W. M. Cox, H. A. Harrison and W. J. Beattie all of Toronto.

The James McKay Co., of Pittsburgh, Pa., manufacturers of chains and forgings have been granted a license to do business in the Province of Ontario with a capital not to exceed $40,000. Franklin W. Wegenast, of Toronto, is the company's attorney .

The Tillsonburg Foundry & Machine Co., has been incorporated at Toronto, with a capital of $25,000 to carry on business as foundrymen, machinists, etc., at Tillsonburg, Ont. Incorporators are Lydney E. Dykeman, David J. Downs and F. James Bushell all of Tillsonburg.

Pressed Metals, Ltd., has been incorporated at Ottawa with a capital of $60,000 to carry on business as engineers, foundrymen and machinists, etc., with head office at Toronto. Incorporators, J. W. Leighton, O. J. P. Crick and Y. H. Chewett all of Toronto.

Canadian Molybdenite, Ltd., has been incorporated at Toronto, with a capital of $100,000, to acquire and develop mines and properties. Head office is at Toronto, and the provisional directors are: Franklin M. McDowell, George R. Sproat and Charles H. Kemp, all of Toronto.

Personal

Henry Clark, Canadian manager for Head, Wrightson & Co., of Stockton-on-Tees, England, bridge and mining machinery manufacturers, is in England on a business trip.

Will H. Baltzell has been appointed chief engineer of the Canadian Steel Corporation, Ltd., with offices at Ojibway, Ont. This is the Canadian branch of the United States Steel Corporation.

Capt. Robert Fraser, marine superintendent of the Montreal Transportation Co., Kingston, Ont., has severed his connection with the company. Capt. Fraser will take up his residence in California.

W. P. Kellett, of the Dominion Steel Products Co., of Brantford, Ont., formerly engineer for the Grand Valley and L. E. & N. Railway, has been appointed to the board who are to make a valuation of Canadian Railways.

A. S. Clarson, C.E., the newly appointed city engineer of Verdun, Que., has been for the past five years, principally engaged as engineer of the electrical commission of the City of Montreal. He was born in England and before coming to Canada was engaged in several important engineering works.

O. R. Sweeny, of Valparaiso, Chile, who is well known in ocean shipping circles, being the General Manager of the Compania Sud-Americans de Vapores, which operates a fleet of steamers along the west coast of South America, from the Panama Canal to Patagonian ports, is visiting Toronto. Mr. Sweeny is touring the United States and Canada, accompanied by his wife. From here he goes to Montreal, Ottawa and Quebec, and then to the Pacific coast.

Contracts Awarded

London, Ont.—Contracts have been let by the McClary Mfg. Co. for the erection of a galvanizing plant.

Copper Cliff, Ont.—The Canadian Copper Co. have awarded a contract to the Ridgeway Dynamo & Motor Co., of Ridgeway, Pa., for a motor-driven compressor.

Montreal, Que.—The Board of Control have awarded a contract to T. O. Sullivan for the construction of a bridge and headgates over the aqueduct canal at Lasalle Road. The work will cost $209,221.

Vancouver, B.C.—Macdonald, Nettleton & Bruce, of Vancouver, have been awarded the contract for the construction of the C. N. R. freight sheds, their tender being approximately $125,000. It is expected that the buildings will be completed about the beginning of next March.

Tenders

Toronto, Ont.—Tenders, addressed to W. C. Wilkinson, secretary-treasurer of the Board of Education, for the Technical School, will be received until Oct. 23, for two complete chassis, one new and one used; engine with four cylinders; electric starter.

Lyall, Man.—Tenders will be received up till October 23 for the supply of transformers, meters, pole line construction, and electrical equipment. Plans and specifications are available at the office of the engineer of the Public Utilities Commission, 300 Tribune Building, Winnipeg.

Hawkesbury, Ont.—The Town Council is calling tenders for one electrically-driven turbine pump of 1,000,000 gal. per day capacity, direct connected to a 100-h.p. motor; one pump of 750,000 gal. per day capacity, with 75-h.p. motor, and for one pump of 500,000 gal. per day capacity, with 50-h.p. motor. M. Gareau is town clerk.

Ottawa, Ont.—Tenders, addressed to J. W. Pugsley, secretary of the Department of Railways and Canals, Ottawa, Ont., will be received up to November 15 for the construction of a reinforced concrete elevator with a capacity of 500,000 bushels. Plans, specifications and blank form of contract may be seen at the office of the following:—Chief engineer, Department of Railways and Canals, Ottawa; railways, Moncton, N.B.; general superintendent, Winnipeg, Man.; resident engineer, Fort William, Ont.; John S. Metcalf Co., engineers, Montreal, Que. Contractors who wish to obtain plans and specifications temporarily for their own use may obtain same on depositing a certified bank cheque for $100.

Toronto, Ont.—Tenders will be received by Frank Barber, engineer of the Township of York, up to October 30, for the supply and delivery of the following material:—Tender A-1—for supply and delivery of approximately 20,500 ft. of 24 in. cast iron pipe; A-2—for the supply and delivery of cast iron pipe (12 in. and smaller sizes); B-1—for supply and delivery of 24 in. special castings; B-2—for supply and delivery of special

QUANTITY PRODUCER

This tool is used in shops where parts are keyseated by thousands. It is fitted with a high-speed steel rotary cutter for milling internal keyseats in one cut. Shops large and small can use the tool, and it is readily attached to a drilling machine for which it is designed. The tool keyseats in places where Keyseating Machine, Planer and Shaper can't reach. The right tool to use for keyseating interchangeable parts. There is no limit to the variety of work possible to be keyseated.

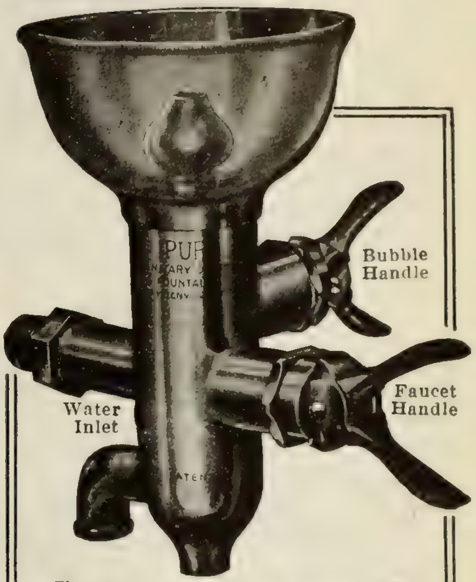
I BELIEVE

In Safety First and always.
In providing for the Health of my Fellow Workmen.
In Light and Air and sanitary Working Conditions.
In clean, fresh drinking water for everybody.
In the Safety, Economy and Man-betterment.

PURO SANITARY DRINKING FOUNTAIN

(MADE IN CANADA)



The loss of a man through impure drinking water is a crime that "the front office" must bear.

An ugly statement, isn't it? But true, absolutely.

When a man comes to work in your factory he puts his health in your keeping.

Are you willing to take chances on such a trust?

Impure drinking conditions are responsible for more tragedies than any machine ever built.

Apply the "Safety First" Principles to your water supply; don't deny your men a clean, fresh drink of water.

Conserve their health and they will improve your profits; make yourself as worthy of the name of "employer."

Install the Gold Medal winner Puro in your plant, office and shop alike.

The only Sanitary Drinking Fountain that is safe, sanitary, simple, automatic in control and easily attached.

Let us tell you just what it will cost you to

castings, 12 in. and smaller sizes; C-1—for supply and delivery of 24 in. valves; C-2—for supply and delivery of 12 in. and 6 in. valves; C-3—for supply and delivery of air valves; D—for supply and delivery of hydrants; F—for supply and delivery of tops, covers and plugs. Plans and specifications may be obtained at the office of Frank Barber, engineer, Toronto.

Wood-Working

Port Hammond, B.C.—An extension of the Hartnell Lumber Co.'s plant, which will practically double its output, is under way. One new dry kiln has already been erected, and another will be started shortly. A new boiler is being installed.

Building Notes

Toronto, Ont.—A permit hat been issued by the city architect to J. O'Neill for an addition to the laundry building at 2 River Street, to cost $3,500.

Toronto, Ont.—A building permit has been issued to the Canada Metal Co. for the construction of a factory extension on Fraser Avenue, to cost $20,000. Work on the foundation has already started.

Marine

Ottawa, Ont.—The Canadian-built icebreaker, sold some time ago to the Russian Government, will be given a trial run at Murray Bay on the 23rd of this month. Representatives of the Russian Government are now supervising the completion of the vessel. The icebreaker was intended for the Canadian Government service and was accordingly christened the "J. D. Hazen," in honor of the Minister of Marine and Fisheries. Her new owners naturally prefer a Slavonic appellation, and she has been renamed his Imperial Russian Majesty's ship Mikula Selianinovitch.

Catalogues

Sand Blast.—A leaflet illustrating and describing a sand blast machine by the Gray Manufacturing and Machine Co., Toronto.

McGregor Swinburne, Ltd., Glasgow, Scotland, have mailed a series of bulletins dealing with an interesting line of chucks which are illustrated and described fully. Among these are included the "Crawford" direct drive drill chuck and slide rest chuck, full particulars of each covering the principal features being given. Other specialties dealt with include the "Glasgow" drill and "Gyro" loose ratchet head.

Tobin Bronze is the title of a 36-page booklet issued by the American Brass Co., Ansonia, Conn., dealing with Tobin bronze and its application. Its physical properties are described and the results of several tests given followed by tables giving approximate weights of rods and sheets. The booklet also contains a number of testimonials from firms who have used this material for various purposes.

Electric Portable Tools.—The Stow Mfg. Co., Binghampton, N.Y., have issued three bulletins: No. 100, containing 20 pages, illustrating and describing electric motors; No. 101, 28 pages, on portable electric drills, grinders, motor driven screw drivers, and other electric tools; No. 102, 60 pages, illustrating the "Stow" flexible shaft, with its many applications. These bulletins are very complete and give detailed information covering the full line of "Stow" portable tools. Copies of these bulletins may be had on application.

A Model Foundry, is the title of a catalogue, No. 124, issued by the Whiting Foundry Equipment Co., Harvey, Ill., giving in a general way the methods followed by the company during its long experience in designing, equipping, and conducting initial operation of foundry plants for making all kinds of castings. A large number of half-tones show the different types of foundry equipment installed, including some typical crane installations and interior views of steel casting and foundry plants. A partial list of foundry plants equipped by the company in the United States and Canada is included.

The Lagonda Manufacturing Co., Springfield, Ohio, are distributing their 16-page booklet, published every year or so as a general reminder and concise catalogue of all the specialties in the "Lagonda" line. The booklet which is entitled "Lagonda" Boiler Room Specialties, illustrates and describes the different types of "Lagonda" tube cleaners and other specialties, one page being devoted to each. The large catalogues are referred to for more detailed information. The booklet will be gladly sent upon request to any engineer who is interested enough to write for it.

The McAlear Mfg. Co., Chicago, Ill., have issued a reference book on the McAlear system of vacuum and vapor heating, which deals with the subject in a comprehensive manner. In addition to a full description of the system, the book contains complete particulars of the various parts and their construction, method of operation and directions for installing. The illustrations include details of the traps and pumps and also several diagrams showing various systems and applications. Copies of this book may be obtained from Arthur L. Leitch, Kent Bldg., Toronto.

The Dearborn Chemical Co., Chicago, Ill., have issued a very attractive and well gotten up booklet entitled "Walter" which deals with the "Dearborn" treatment of boiler feed water. The subject is discussed under the following heads:—Corrosion, incrustation and foaming, the cause and effect in each case being dealt with in a scientific, yet practical manner. Particulars are given of the principal scale—forming solids and the reason why they are harmful, while the subject of electrolysis is also discussed. The illustrations show excellent exterior and interior views of the company's factory and offices, while the covers have a very artistic and attractive appearance. Copies of the booklet may also be obtained from the company's branch factory at Toronto.

Burd Piston Ring Directory for 1916 has been published by the Burd High Compression Ring Co., Rockford, Ill. This publication is a directory of piston ring sizes, which includes a tabulation of the piston ring requirements of practically every automobile of any import manufactured in the United States during the past ten years, besides information of like character covering the requirements of aeronautical, marine, stationary, and other types of internal combustion engines. The book is an invaluable source of information for garage men and those engaged in the repair of gasoline engines, and contains data on proper fitting and installation of piston rings, regardless of by whom manufactured. Stock sizes are indicated by an asterisk, which follows the telegraphic code word for every size listed. An additional telegraph code is provided, affording means of communication between the customer and the factory. This directory, while being more exhaustive than any other treatise of its kind ever attempted, is distributed among the garage trade free of charge.

Book Review

"Fundamentals of a Cost System for Manufacturers" is the title of a bulletin issued by the Federal Trade Commission, Washington, D.C. This bulletin has been prepared with a view to aiding the campaign of education by explaining what a cost system is, how it operates, the results obtained, and the benefits to be derived from its operation. This bulletin shows briefly the importance of accurate manufacturing costs and the fundamental principles underlying them. Copies may be obtained from the United States Government printing office. Washington, D.C.

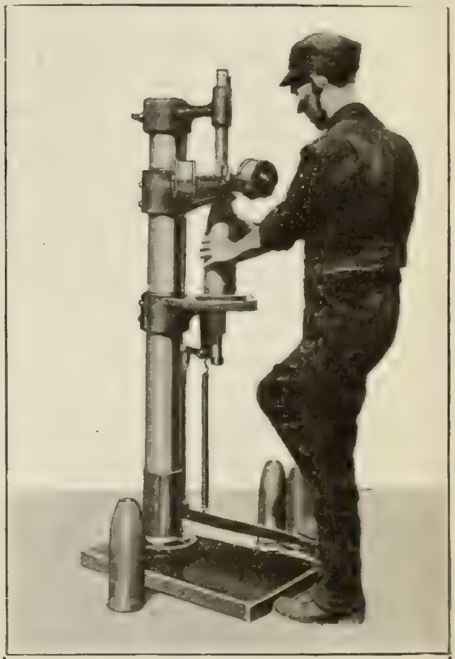
CANADA'S DEPARTMENTAL HOUSE FOR MECHANICAL GOODS

MONARCH
Milling Machine
(Made in Canada)

For Milling the three slots in the nose of

Mark 7 Shells

Adjustable to take any size shell from 4.5 to 9.2 inclusive.



ONE MOVEMENT of foot lever clamps the shell and feeds the three cutters in to the right depth.

CAPACITY ON 4.5—6 to 8 shells per minute. Actual cutting time is simply — "zip" and the three slots are finished.

THE MACHINE is complete with High Speed Cutters and drive pulleys which should run at about 550 revolutions per minute. It can be driven by three 2-inch belts, either from overhead counter or line shaft. The clamping device does not interfere with copper band, and altogether it will be found to be a very satisfactory tool—CONVENIENT and ACCURATE.

The man with money

In Canada, if you are a man with money, or called upon to advise others in regard to money matters, you will find it to your advantage to read a sanely edited, broadly informed and clear-visioned financial newspaper, such as "The Financial Post of Canada." The Financial Post is, beyond question, Canada's most authoritative newspaper serving investors and those concerned with the money market. The wide organization and many papers of The MacLean Publishing Co., together with the experience and ability of the Editors, make this pre-eminence possible.

THE
Financial Post
OF CANADA

The Canadian Newspaper for Investors

$3.00 PER YEAR

One advantage which subscribers have is the service of the Investor's Information Bureau of "The Post," where special information and advice are provided, without any fee, by personal letter. This service is very valuable to investors.

We suggest that you buy a copy of the current issue from your newsdealer, and make a careful examination of it. Ask your banker or broker about "The Post." Get independent opinions regarding it from the professional classes who handle money. Sample copy on request.

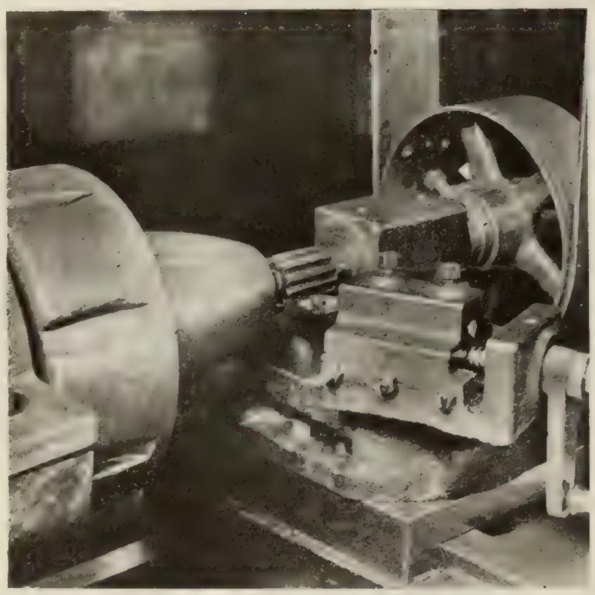
4.5 Mark VII Plant For Sale

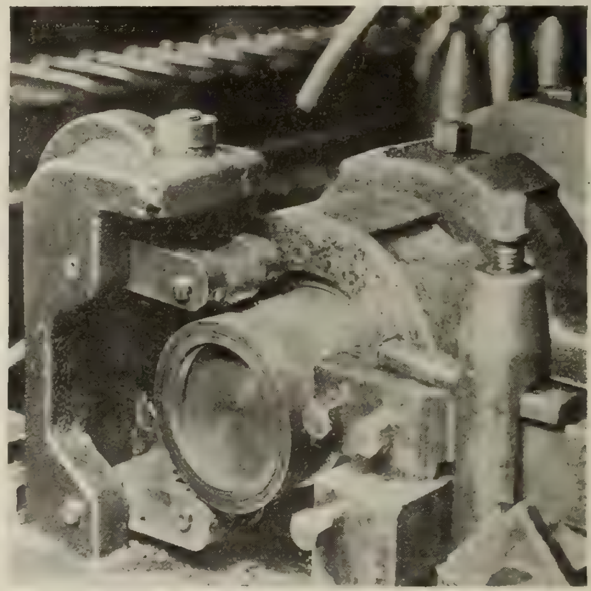
Immediate Delivery

The following machines have been changed from the mark V shell to the mark VII. We will dispose of these machines with their tooling. Every machine has been examined and put into first-class shape.

2—30" American Turret Lathes, Triple Geared; 36" turret base; will take both 3" and 4" boring bars; extension heads on turrets; special small turret or cross-slide with six 1½" holes; 20" 3 jaw Universal steel chucks; Power Feed and Power Reverse. All tooled, boring bars, pot chuck, etc., each	$1300
1—22" x 10' Pond Engine Lathe; back geared and screw feed. All tooled for outside profile operation on Mark VII. shell	$525
1—22" x 10' London Single Drive Engine Lathe; quick change gear box with screw and rod feed. All tooled for outside profile operation on Mark VII. shell	$700
1—24" x 10' Lodge & Barker Back Geared Engine Lathe; screw feed. All tooled for outside profile operation on Mark VII. shell	$500
2—24" Morse Turret Lathes; with 3-jaw Universal chuck; 16" base turret having six 3" holes. All tooled, with pot chuck, for hogging-out base of Mark VII. shell, each	$800
1—Jenckes Band Turning Machine; collet chuck. This machine has band-turned about 15,000 shells. All tooled for Mark VII. shells	$900
1—24" x 12 Bertram Engine Lathe, all tooled with special milling fixture for threading the base recess of Mark VII. shell	$900
1—24" Morse Special Turret Lathe; carriage feed; all tooled with pot chuck and forming tool for finish base recess of Mark VII. shell, each	$900
1—4.5 Brown-Boggs Marking Machine, latest model. New	$200
1—Special Painting Machine, with 110 volt alternating current motor	$50
1—150-ton Hydraulic Nosing Outfit, consisting of 1 Triple Action Pump (Perrin); 1 Accumulator (Perrin); 1 Nosing Press (Perrin), with Mark VII. die complete; 1 Chapman Banding Attachment for Press	$1075



The only correct time to perform the seating operation is to do it in the same fixture with the milling operation. This fixture will fit any engine lathes, and costs only $120.00, including milling, cutter and seating tool. The angle of seating can never vary.



Most of the British Shells may now be knurled. This fixture is quick in operation and most accurate. The cost is only $100.00, and it can be used as an attachment to almost any lathe.

We have all gauges for both Mark V and Mark VII Shells, consisting of plug, length, outside diameter, form, thread and seating gauges.

Our Nosing Die Outfit is the best for the Mark VII shell. Leading manufacturers, such as P. L. Robertson Co., Milton; Wilford & Co., Lindsay; Manitoba Engines, Ltd., Brandon; Canadian Westinghouse, Hamilton; Vancouver Engineering Works; Vulcan Iron Works; Otis Fenson Elevator, etc., are using our dies.

It Means More and Better Work when the Operator likes the Grinding Machine

Some of the features that make B. & S. Plain Grinding Machines profitable workers:

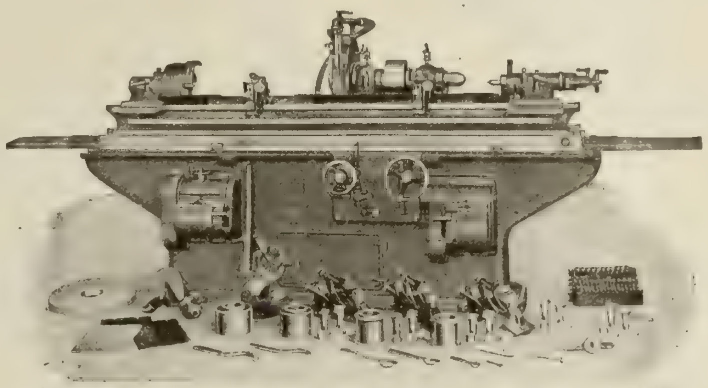
Proper Work Support.—Combination Plain and Universal Back Rests furnish a rigid support for heavy work, a semi-universal support for medium work and a full universal support for small diameters.

Correct Speeds and Feeds.—Work speed and table feed changes are instantly made through two independent quick change gear cases, handy to the operator.

Automatic Sizing of Work.—The Automatic Cross Feed is readily set, without reference to graduations, to automatically reduce work to the required size.

Rigid Construction.—Bed, table and wheel slide are heavily designed and well braced to resist vibration, but clumsiness is avoided.

Suppose the operator is ever so efficient, he won't make much of a showing unless the grinding machine meets him half way, unless he feels it is responsive to his hustling spirit. He asks, is it easy to run? —there's a good day's work without over-exertion. Is it easy to set up? —no time wasted getting it running correctly. Then, is it reliable? — constant worry and resetting slow up the work. Brown & Sharpe Plain Grinding Machines answer these questions favorably and fully. It is their operating convenience and productive capacity which makes them generally favored by operators and keeps the grinding costs low.



No. 10. Plain Grinding Machine. Capacity 10 in. diam., 72 in. long.

Brown & Sharpe Mfg. Co., Providence, R.I.

The "ERIE" Steam Drop Hammer

is the last word in Hammer construction. Ask any user.

A list will be supplied upon request.

We also build Trimming Presses.

Single and Double Frame Steam Forging Hammers, and Tool Dressing Hammers.

Erie Foundry Co.

ERIE, PA.

Don't Keep It--Sell It!

If you have a lathe
a drill
a milling machine
a planer
a chain block
a chuck
a motor
a crane
a stock of belting
an engine
a compressor

or any other machine shop equipment for which you really have no further use, why not turn it into *cash?*

Someone may be looking for just the machine you may want to sell. Let us bring you together.

A "classified" ad. in CANADIAN MACHINERY, costing a few cents per issue, has done wonders for others. Why not try it?

Turn to the "Classified" section in this issue and see what is being offered and what is wanted at present.

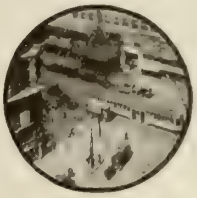
143-153 University Avenue TORONTO, ONT.



The Man in the Street

As you look down from a high office building, the struggles of the man in the street seem trifling and puny—the distance dims his efforts no matter how successful they may be—

And perhaps from your desk it may seem as though we tool manufacturers were waging but a listless fight against the tidal wave of your demand—though a close-up view of our plants would show you otherwise—

All Records Broken

Today those machines we ordered months ago are beginning to whirr and hum; production has been increased a little here and a little there; months of strenuous effort are bearing fruit—today *more "Cleveland" drills are being shipped to "Cleveland" customers than ever before in our history.*

But we are not resting on our oars—nor will we until our service becomes all that you could ask regardless of the extraordinary handicaps under which we have been forced to operate.

Send for Catalog No. 358.

MACLEAN'S

for NOVEMBER

WANTED—A NATIONAL ANTHEM. Perhaps you yourself have felt in these times of intense patriotism Canada's lack of a real National Anthem; and, if so, Arthur Stringer's magnificent presentation of Canada's need in the November MacLean's will make you say "Amen and Amen." : : : The problem of the returned Soldier—a phase of it—is the subject of a special article which has the sanction and approval of Sir James Lougheed, President of the Military Hospitals Commission; a contribution of genuine interest to all business men : : : Business men will be glad to learn that the fine monthly Business Outlook article is to be added to by a department headed "Information on Investments" : : : Another excellent and timely contribution is "Putting the Crop Across" — how Canada markets her wheat.

H. F. GADSBY writes on "Conserving the Conservatives"—a political article that both Liberals and Conservatives will find good reading : : : Peter McArthur, farmer-author, begins a series of stories in the November Number with "The Witch of Atlas"—extremely good : : : Robert W. Service has another "At the Front" poem—"Fleurette," strong yet tender : : : H. M. Tandy, a Canadian writer of fine ability, has a story, "Straw-Stack Strategy"—fine! : : : Serial stories by Arthur Stringer and Arthur E. McFarlane.

This Man is as Efficient as his File

—and because he's a skilled mechanic, he prefers to work with one or other of the "Famous Five" Files.

He likes their balance. He appreciates the quality of the steel in them and the innumerable grades of Files he can obtain to fit the different kinds of work he has to do.

If you could take a vote from among the men in your factory, you would find that they all know the "Famous Five" and prefer to work with them.

It is just as well to specify them when ordering.

The "Famous Five" are:

Oxy-Acetylene Welding and Cutting

The above shows the Prest-O-Lite Process as used in the manufacture of metal furniture.

Metal Furniture Made by Welding

Makers of metal furniture of all kinds are using the oxy-acetylene welding process to obtain stronger, better and neater joints than are possible by other methods.

This process is effecting marked economies in production costs. It provides a means of greatly simplifying the manufacture of intricate metal parts, speeds up production and improves the quality of the finished article.

The same process, so widely used in manufacturing operations, is equally useful and efficient for hundreds of jobs in and around the shop.

When emergency repairs are needed to avoid a possible shut-down of important machinery, this portable welding outfit will quickly and efficiently repair the break right "on the spot" oftentimes without moving or dismantling the machine.

Prest-O-Lite PROCESS

Employs both gases (acetylene and oxygen) in portable cylinders. Prest-O-Lite Dissolved Acetylene (ready-made carbide gas) is backed by Prest-O-Lite Service, which provides dry, purified gas, insuring better welds, quicker work and lower cost, and also avoids the large initial outlay and heavy depreciation incurred in making crude acetylene in a carbide generator.

Necessary equipment is not expensive. We furnish high-grade welding apparatus for $75; acetylene service at additional cost. Adaptable for oxy-acetylene cutting by the addition of special cutting blow-pipe. Thorough instructions are furnished free to every user of Prest-O-Lite Dissolved Acetylene; any average workman who understands metals can learn the process quickly and easily.

Let us send you interesting data and illustrated literature on many welding operations—important savings that others are now making.

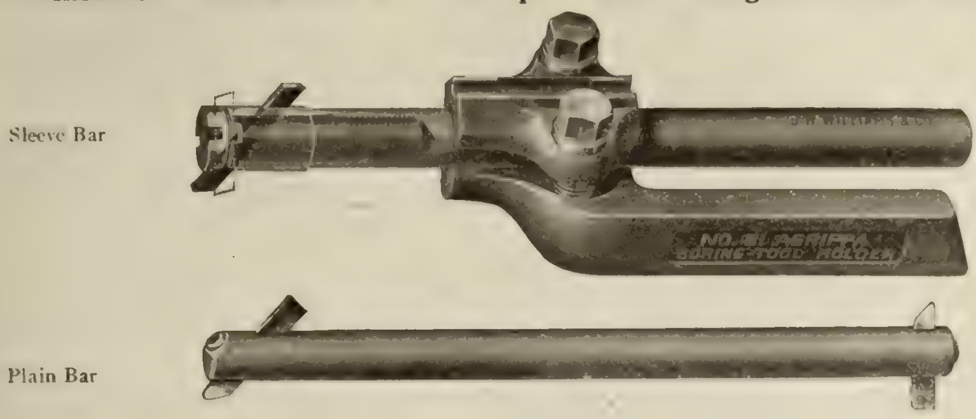
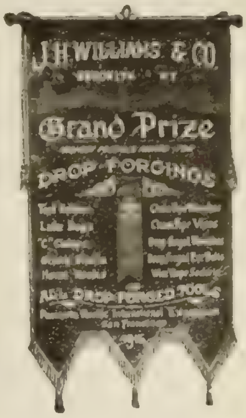
Williams' "AGRIPPA" Multiple Bar Boring-Tool Holder Stops Waste





ITS sleeve bar cap admits a straight or angular cutter: and you can quickly insert either at the business end of the bar without removing the cap or disturbing the setting of either the bar or the holder.

You need neither make nor buy any bushings hereafter, for the "twin screw" fastenings of "AGRIPPAS" within their range accommodate any bar section you may have handy.

Now's the time to begin saving—caps, bushings and time!

Procure our tool holder text book here or from your dealer and learn the many other economies afforded by

For riveting base plugs in shells of high explosive type of 4.5", 5" or 6" size.

The
Grant Riveter

Does its work with speed and thoroughness.

The riveting device is actuated by compressed air, and is fitted with a foot treadle which brings the hammer into action, leaving the operator with both hands free to handle the work.

The hammer strikes about 1,000 blows per minute, which enables the plug to be **riveted perfectly tight** in one complete revolution, occupying about **20 seconds**.

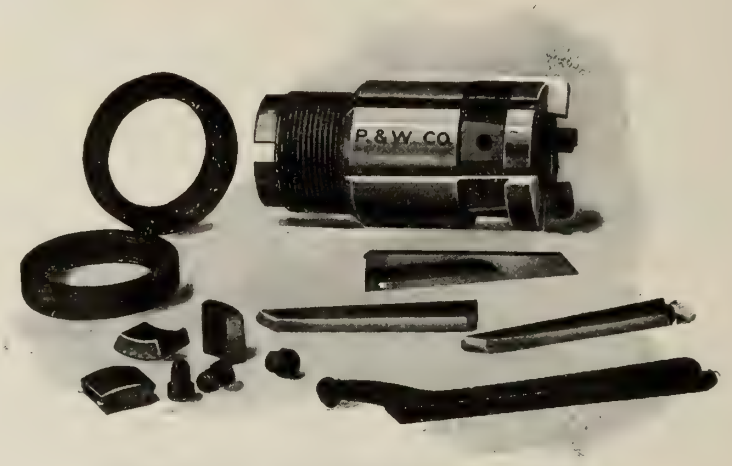
BERTRAM MACHINE TOOLS

are built for safety and service, and are backed by a concern with sixty years' experience and the largest of its kind in Canada.

REAMERS
ALWAYS UP TO SIZE

Make sure that all your reamed holes are smooth and accurate.

STANDARD
1/2
/8



Parts of P. & W. Solid Adjustable Blade Reamers.

USE P. & W. SOLID ADJUSTABLE BLADE REAMERS

Unexcelled for Design, Simplicity and Ease of Adjustment.

1. The eccentrically relieved blades are stronger than others, do not chatter and produce a smoother hole.

2. The hand, shell and fluted chucking reamers have interchangeable nuts, screws and wrenches.

3. The bottom of a hole can readily be faced.

4. By a simple adjustment of the blades the reamer can easily be set to size without regrinding.

REDUCE YOUR REAMING COSTS

Acres of Diamonds

RUSSELL H. CONWELL wrote a lecture entitled "Acres of Diamonds," delivered it fifty-two hundred times, made a million and a half dollars out of it, and spent all the money sending deserving young men through college . . . says an advertisement in *Printers' Ink.*

The story runs that a certain Arab, whose mind had been powerfully affected by stories of the discovery of diamonds, sold his humble farm upon which he had passed his life, and with the proceeds went out to hunt for diamonds. In the meantime, after its former owner had spent all of his money and died of disappointment, the largest mine in the world was discovered on the very farm from which he had parted so lightly.

There is an application of this little story for mechanics, if we but pause to find it.

Between the covers of this issue of CANADIAN MACHINERY may lurk an idea which may mean success or failure to more than one mechanic — perhaps to you.

A casual, careless glance through may not disclose the gem of information you may be seeking. Get the habit of reading carefully. Mark items of immediate interest and preserve those required for future reference.

The advertising section, as well as the editorial articles, will be found rich in "pay dirt," even if you don't strike a pocket of diamonds.

Do a little prospecting right at home.

Quality **Service**

Courtesy in Business

* * *

Fittingly framed and hanging in the Offices of one of the most important Public Service Corporations on this North American Continent is the following

> **'Did you say Please and Thank you?'**

Broad minded men direct the destiny of that Corporation, men who know that public or private enterprises to be lastingly successful must operate for the public good.

Quality and Service are the two important factors in our business life today, but Courtesy is the door through which they must enter.

We are large producers of Hamilton Pig Iron and our output of Open Hearth Steel Blooms and Billets, Iron and Steel Bars of all shapes and size runs into enormous tonnage.

The products of our mills include practically everything that can be manufactured from Iron and Steel and these we distribute to thousands of satisfied customers.

Our business is an extensive one and a successful one. The World is our market: but our prosperity and success in the future, as in the past, depend upon the continued confidence, co-operation and good-will of the people we serve.

"BRIDGEFORD" 27-in. HEAVY DUTY LATHE

The Ideal Machine for Rough-Turning Shells

This is an especially heavy duty machine, and as shown in the engravings, is arranged for rough-turning 8", 9.2" or 12" shells. Power is transmitted through 8" driving belt, with three instantaneous speed changes through hardened steel gearing. Main driving gear 6½" face. Four instantaneous feed changes—all through cut steel gearing, running in oil. Leading shell manufacturers have from 70 to 120 of these machines in operation—giving remarkably satisfactory results.

Owing to greatly increased facilities, we can make early deliveries on Bridgeford lathes. Write us.

STEEL

for

SHRAPNEL SHELLS

AND SHELL BLANKS

Only Company in Canada producing steel ingots by the "HARMET" Liquid Process.

REASONS WHY THESE INGOTS ARE SUPERIOR TO THE ORDINARY KIND:

1. Prevention of cracks, due to shrinkage; of internal stresses and resulting cracks and fissures.
2. Early cessation in the crystallization of the metal, and the production of fine crystallization of the metal, without cleavage planes.
3. Lessening of segregation, i.e., reduction of tendency to carbon and other impurities to concentrate in the central and upper parts of the ingot.
4. Prevention of "Pipes" or interior cavities, and thus preservation of absolute solidity in the ingot.
5. Improvement in physical properties.
6. Reduction in waste of ingot.

WE CAN SUPPLY FORGINGS OF ALL SHAPES AND SIZES MADE OF ORDINARY OR "HARMET" FLUID COMPRESSED OPEN-HEARTH STEEL ON THE SHORTEST NOTICE.

GET THE BEST

You must figure as close in the shell-making game as in any other line. Nothing but the best machines should be installed if efficiency of operation and maximum of production are to be secured.

The Jenckes Single Purpose Lathes for shell work have established themselves with shell makers as the best and most efficient machine tools yet designed for this class of work.

Illustration shows the latest of these—a Banding Lathe for 8" shells. Note the liberal proportions, the general appearance of sturdiness. They mean an extra measure of long and efficient service.

These machines are also manufactured for 18 pdr. 4.5", 5", 6", 8", 9.2", 12" and 14" shells; are tooled when required for the mm. sizes corresponding to Russian and French ammunition.

SHEFFIELD, ENGLAND

STELLITE

HIGH SPEED TOOL METAL

MADE IN CANADA
STELLITE

NOT A STEEL

CONTAINS NO IRON

Run your machines faster and get larger production

If your steel tools won't stand faster driving use "Stellite." It won't burn up no matter how fast the machines are driven, for it has no temper. Stellite cuts as well when red hot as when cold. It eliminates the necessity of cutting compound. Increases output 20 to 300 per cent, at no extra cost for equipment.

It is hard. It is tough; use according to directions and it will give you the most startling demonstration of turning you have ever seen.

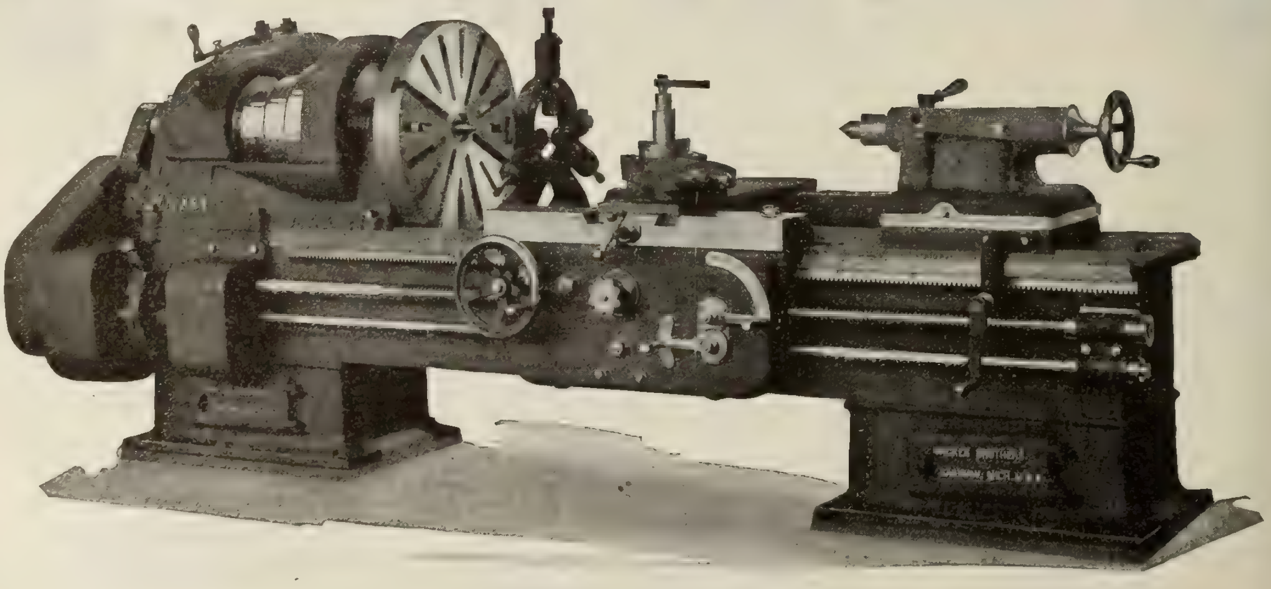
METAL and WOODWORKING MACHINERY of all Kinds

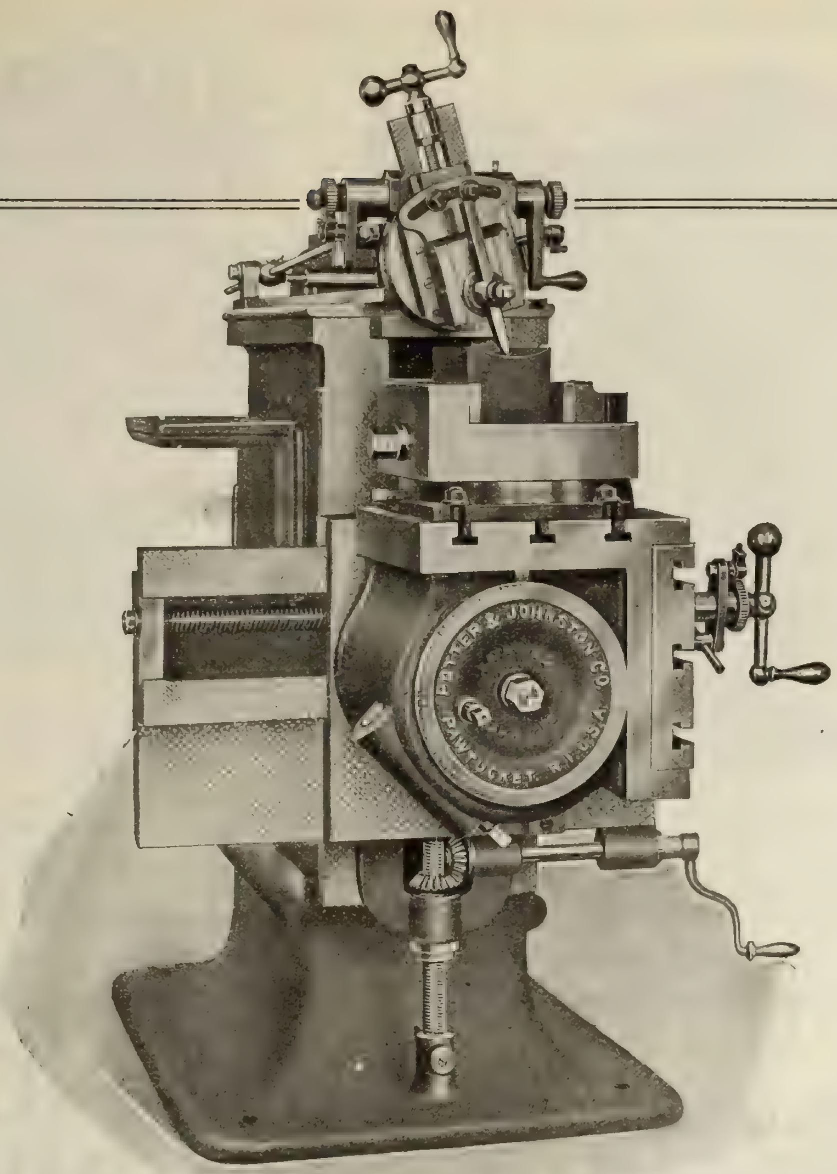
Wickes Heavy Duty Engine Lathe



The Wickes 26″ Heavy Duty Lathe.

Built in lengths from 8 ft. up. Has 3-step cone, is double back-geared and has double plate apron.
This tool is built for the most severe service; all parts liberal in size; has special ball thrust bearings; steel apron gears; coarse pitch and wide face gears, which are all well guarded.
Let us tell you about this lathe and our 20″, 32″, also our 17″ Rapid Production Lathe for Automobile and other work.
We can make prompt shipment.

WICKES BROTHERS **Saginaw, Michigan**



Potter & Johnston 15-inch Universal Shaping Machine

Simplicity of design, convenience, extreme care exercised in their manufacture, and the many universal features of the machines, combine to make the UNIVERSAL SHAPING MACHINES the most efficient and thoroughly reliable tools of their type on the market to-day, and place them in a class by themselves. The above illustration shows our 15" Universal Shaping Machine with Swivel table having auxiliary tilting side, power down feed on any angle, POWER ROTARY FEED for planing internal curves, automatic feed stop, graduated collars on tool head feed screw and table feed screw, swivel vise with graduated base.

For Turning, Facing and Milling the thread on Gas Check Plugs for 6-inch High Explosive Shells.

THE BANFIELD PLUG MILLER

Patents applied for in Canada and United States

THIS machine is especially designed for finishing base plugs, turning the outside diameter, finishing the face with any camber desired, and milling the thread, all in one chucking, the complete plug being finished in six minutes by unskilled labor.

The machine is equipped with quick draw in collet. Drive pulley 18" x 6", with bronze bush having cut jaw clutch for turning and facing. Worm gear 100 to 1 ratio, with cut jaw clutch for milling. driven by 10" x 1½" flanged pulley. The milling cutter is driven by an 8" x 2½" flanged pulley. Tool post carriage is equipped with power feed (two speeds) having automatic stop. Power feed pump with relief valve driven from worm shaft **(all drives direct from main line shaft).** Rigidly built, simple and economical to operate.

Weight 1,800 lbs.

For 18 pdr., 4.5 and 60 pdr. High Explosive Shells, Can furnish machines of same type, but somewhat lighter in construction. Particulars on request.

These machines are tooled up for finishing plain machined plugs if desired.

20-inch Heavy Duty Manufacturing Lathe

DESIGNED AND BUILT ESPECIALLY FOR MACHINING HIGH EXPLOSIVE AND SHRAPNEL SHELLS UP TO AND INCLUDING 8-INCH. USED AND ENDORSED BY SOME OF THE LARGEST AND MOST SUCCESSFUL SHELL MANUFACTURERS.

DESCRIPTION

HEADSTOCK—All Headstock journals are provided with well lubricated, renewable bronze bearings.

Alternate heat treated steel and bronze washers take the end thrust and a simple adjustment is provided to take up wear.

All gears are covered with neat and substantial cast iron guards that may be quickly removed when desired.

BED—The Bed is of deep construction and width to give the greatest rigidity under heavy cuts.

The shears are made extremely massive and the bed walls extra thick, providing the necessary mass of metal to absorb the vibration and shocks incident to heavy turning at high speeds.

Heavy box girths tie the front and rear walls of the bed together at close intervals.

Improved type wide angle V on front shear to take thrust of cutting tool.

The rear bearing of carriage on bed is flat instead of V-shaped.

At the rear of the bed planed pads are provided for attaching Taper and Forming Attachments.

CARRIAGE—The bridge is very wide and extraordinarily deep; it will not spring under the heaviest cuts.

The carriage is gibbed to the bed at the rear on the outside and will not lift under any conditions.

APRON—The apron is of heavy double plate type affording a support or bearing to both ends of all shafts.

Apron is tongued and grooved to the carriage, also bolted and dowelled.

The feed friction has a greatly increased diameter and will pull the heaviest feeds and cuts without slipping.

For engaging the friction a hand wheel several inches in diameter is provided and seats the friction firmly with very small effort on the part of the operator.

All studs in apron revolve and simple but adequate oiling facilities are provided.

FEEDS—Positive Gear drive through headstock spindle steel gears in gear box, three rates of feed are provided for through sliding key type. Feeds per revolution of spindle being ⅛ in., 1-16 in. and 1-32 in.

All gears in the feed train are fully guarded.

TAILSTOCK—The tailstock is a massive casting, rigidly braced internally, and is provided with a long nose, making it unnecessary to extend the tailstock spindle for ordinary work.

It is clamped to the bed by four large locking bolts operated at the top of the barrel.

A simple binder locks the tailstock spindle in correct alignment, this clamp is located at the extreme front end where it grips the spindle with the utmost rigidity and absolutely does away with distortion of any kind.

The screw is unusually large to resist any buckling tendency.

Suitable screws are provided for setting over for Taper Work.

EQUIPMENT—Unless otherwise specified Lathes are furnished with 8 ft. bed, one driving plate, hand cross feed, heavy duty plain rest, necessary wrenches, and two speed tight and loose countershaft.

Forming attachment, turret tool post, hand or power feed bed turret, oil pan, pump, and connections can be furnished as extras when desired.

DIMENSIONS

Machining High-Carbon Steel with a Connecticut

THE Connecticut Lathe illustrated below is for the machining of high-carbon steel at maximum speed—this lathe combines power, accuracy and rigidity in fullest measure.

The bed is cross ribbed with heavy box shaped girths 15 inches apart. All gears and pinions are of steel except the big gear, which is semi-steel with 4-inch face. The head stock, the tailstock—every detail from pulley to base—are built to the most liberal dimensions. The utmost power is built right into Connecticut Lathes.

The Name HEPBURN on a Lathe for Shells

You won't find Hepburn Lathes being scrapped to make way for better ones: but we can tell you of Heavy-Duty Shell Lathes that have been scrapped to make way for a "Hepburn."

The HEPBURN has five essentials in maximum measure –

Speed, Accuracy, Power, Strength, Simplicity

To these may be added two other characteristics—rigidity and design. Rigidity is included in the term "strength." However, we define it because it is a thing you must look for.

Hepburn Heavy-duty Shell Lathes are helping the Allies to win the war. They are enabling shell makers to make more and better shells in a day than can possibly be made when a second rate lathe is used.

You may have been "Stung" when you bought your first lathes. If so—play safe—learn about the Hepburn.

N.B.—We can ship promptly. We make turning and turret lathes up to and including 9.2".

TORONTO, CANADA

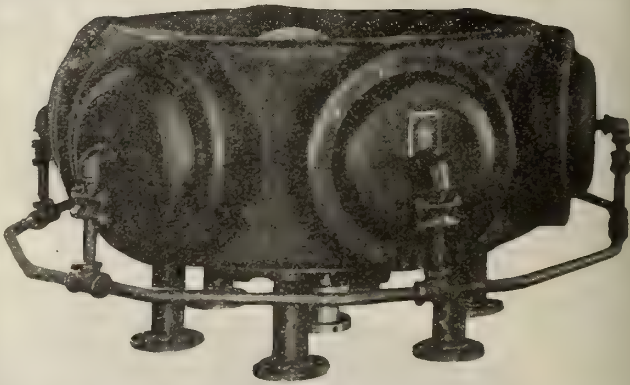
For 6″ to 12″ Shells



"Metalwood" Banding Press

Has a remarkably sturdy construction. It stands up to the most severe service and constant use.

While the price of this press is somewhat higher than others on the market, customers who have used both unhesitatingly prefer our machine, even to the point of discarding other types.

Rams—6—Semi-steel 11″ diameter. Move of each ram ½″ or more if necessary. All rams returned by levers on plate with heavy Vanadium Steel Spring. Cylinder—Removable, of alloy steel.

Hydraulic inlet to cylinder 1¼ pipe. Distributing ring 2″.

All pipe, seamless steel tubing; all fittings, drop-forged steel. All parts under strain, alloy steel castings or forgings.

Dies 6, forged chrome nickel steel, hardened and removable. without disturbing any part of press by loosening 2 nuts.

Weight 9,500 lbs.

Can be operated either from accumulator or pump.

Metalwood Manufacturing Co.
Leib and Wight Sts., DETROIT, MICH.

HYDRAULIC MG MACHINERY

Equip Your Hydraulic Presses

With High-Pressure Hydraulic Valves—

If you are controlling the operation of your hydraulic presses with inefficient, low pressure hydraulic valves, you are working at a big disadvantage. Good work cannot be expected from your presses as long as you experience valve trouble. There is one way only to eliminate this trouble—the use of perfectly designed and well-built high pressure hydraulic valves. "Mount Gilead" Hydraulic Valves are such valves—let us tell you about them.

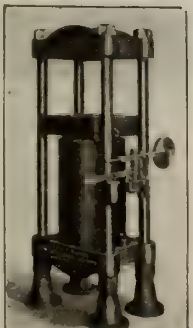
Open Back Inclinable Power Presses

Stand out as the foremost machine for all-around efficiency.

The increased bed area and die space—new form of knock-out in slide, hammer forged Pitman screw and crank shafts, new pattern inclining attachment, are but a few of the advantages.

Twenty sizes from 250 to 9,000 lbs. weight and adapted to nearly every kind of blank cutting, forming, perforating, drawing, shaping and combination die work.

The Toledo Machine & Tool Co., Toledo, Ohio



Elmes Hydraulic Press No. 676

With ¾-in. Automatic Lever Operating Valve No. 677-A

This press is of steel and semi-steel construction, and the stands which support the press are threaded at the ends to receive the steel columns and have holes for fastening to the floor. The platen is guided by the columns.

The operating valve is attached to the cylinder, and is designed with a weight to be set for the pressure desired, and releases automatically. To start the ram up, the lever is pushed down; upon the ram reaching the desired pressure, the lever automatically releases (acting as a safety valve as well), causing the ram to descend. Valve body is made of bronze, and other parts are made of tool steel and machine steel. If desired a hydraulic gauge can be attached to show the various pressures, although with this valve it is not necessary.

Write for our Hydraulic Machinery Catalogue.

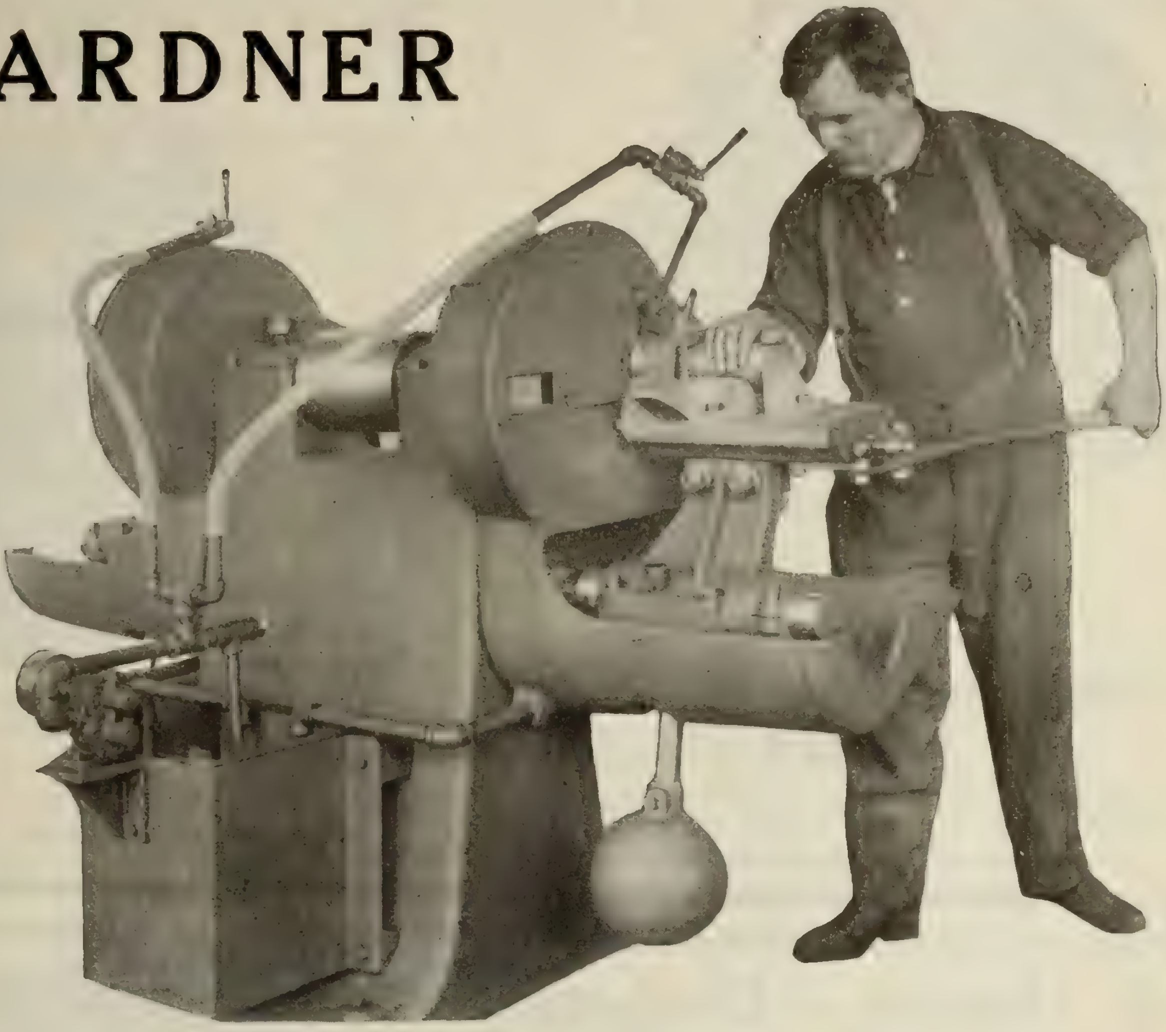
GARDNER GRINDERS



For Grinding Ends of Shells

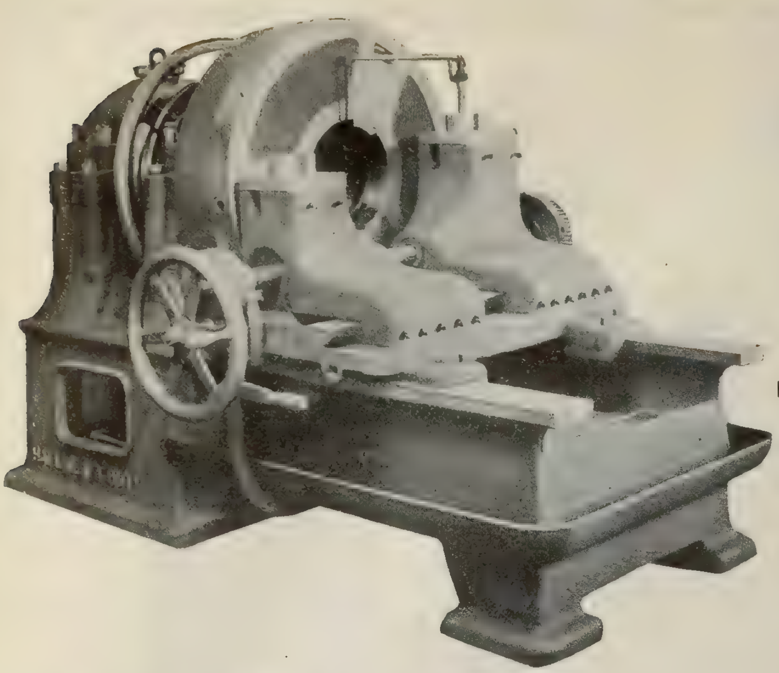
We have developed a Special Grinding Machine for removing the hub or centre projection from the ends of shells. This grinder is also used for cutting off the square or angular hubs from High Explosive Shell Base Plates.
We build as well a much heavier and more Powerful Grinder to be used for these same operations on 6" Shells.

FEATURES

- **High-Grade Babbitt Bearings and Lever Feed.**
- **Rapid clamping of Shell into "V" fixture.**
- **Pump and water system driven from countershaft directs the water or grinding compound at point of grinding contact.**
- **Can be equipped and operated at both ends for double output.**
- **Output, according to size of projection to be removed, from 40 to 100 per hour.**
- **Equipment includes two 16" Perfection chucks, two 16" abrasive ring wheels, two semi-universal lever feed work tables, two shell-holding fixtures, water and pump, with connections; countershaft and usual attachments.**
- **Weight, 4,500 lbs.**

For further particulars write

The Gardner Machine Company, Beloit, Wis., U.S.A.



Cut illustrates our No. 12 cutting-off machine for cutting-off and facing 6", 8", 9.2", 10" or 12" shells.

The bed of the machine is of the box lathe type, with sufficient weight and strength to give great rigidity under the severest strain.

We manufacture a full and complete line of machinery used in the manufacture of shrapnel, 4.5, 60-Pr. and 10" shells.

Cutting-off machines range from 1½" to 12".
For cutting off the open ends.
For facing off the closed ends.
For facing off projecting ends of plugs.
For cutting off bar stock.
For cutting off ingots, any size.
Pipe lathes ¼" to 18".
Double and single head nipple cutters.
Roller pipe cutters.

HUNTER SAW & MACHINE COMPANY, Pittsburg, Pa.

Shell-Steel Cutting Time

on the PEERLESS High Speed Heavy Duty Metal Cutting Saw

PEERLESS
PEERLESS
MACHINE CO
RACINE WIS USA

Owing to the toughness of this material it was selected for cutting time, and under extreme feed the actual time on cutting 5 in. round is 7¼ min. Regular stock blade was used, 12 x ¾, 18 gauge, 10 pitch.

A machine that will stand up for such heavy duty work must be properly designed and rigidly constructed, and to stand the wear and tear the right grade of material and workmanship must be embodied, and that is just what you will find in the PEERLESS High Speed.

As a real time saver in operating and adjusting, it is in a class by itself. For an example, more than six cuts per minute can easily be made on a ½ in. round cold rolled steel bar. This covers the time in starting and stopping on each cut. The PEERLESS not only saves time, but also increases the production.

Again we say, the actual time saved in operating and adjusting the PEERLESS High Speed is a big item that is well worth investigating.

Again we suggest, before considering any other cutting-off equipment, write us for a complete description.

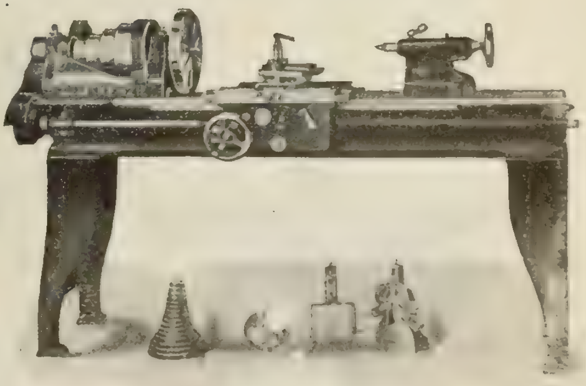
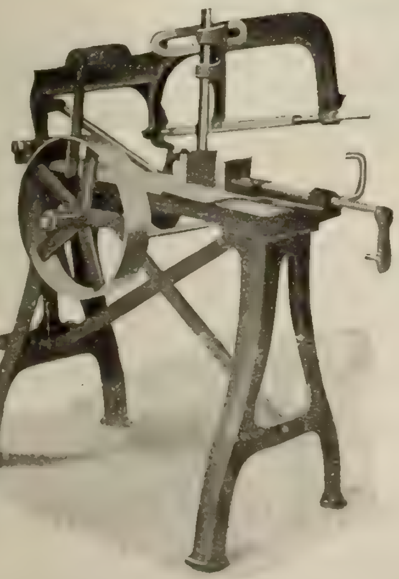
The Standard of Accuracy

Made from new patterns, of improved design, and constructed of the very best material by expert workmen. Every part is mechanically perfect and excellently finished. Its accuracy and durability mean a big saving of money to you.

Let us put full details before you. Write!





The Improved Power Hack Saw

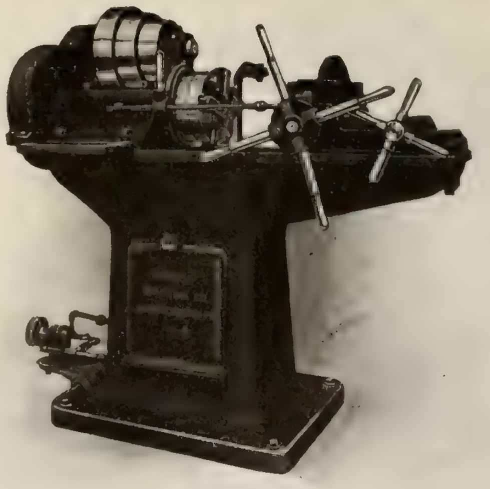
will cover its cost many times over with the money it saves through long, efficient service.

Saws bars 6 x 6 in., either round or square, and is so constructed as to require no attention after work is put in vise, and stops automatically when piece is cut off.

The improved Saw Guide is a Special Feature—it keeps the saw perfectly in line at all times.

The D. McKenzie Machinery Company
Guelph, Ontario

Not ONE Feature at a Sacrifice of Others.



That is why the Landis die is conceded to be the most efficient threading tool on the market.

Efficiency in thread cutting depends upon the quality of threads, the quantity and a low cost of upkeep.

The Landis chaser has a controllable rake or cutting angle which insures clean-cut, well-formed threads at all times.

The chaser is tangentially disposed to the stock, thereby reducing the friction to a minimum and permitting of the highest possible cutting speeds.

The chasers, when dull, are merely given a slight grinding at the cutting edge and advanced in the holders, eliminating the necessity of annealing, hobbing and retemperng.

There are other features which, added to the three stated above, produce a greater degree of accuracy and a higher production at a lower cost of die maintenance than is possible with any other threading tool.

Let us show you.

Motor Driven Speed Lathe

This style of motor drive employs a constant speed motor mounted on a plate having an extension arm to support a bearing for the outer end of the motor shaft. The motor plate is fitted to a slide on a shelf which is securely fastened to the back of the lathe bed. The motor plate is moved by means of a screw which tightens or loosens the belt. A four-step cone pulley on the motor shaft is belted to a four-step cone pulley on the spindle. This gives the same speed variation as when a countershaft is used, and by means of various size cones on the motor a wide range of speeds are obtainable.

The lathe spindle is made from high carbon steel, ground to size, and running in self-oiling bronze bearings. The tailstock has screw and lever feed. The bed is cross-braced and all clamping levers are above the ways.

Put This Free Book in Your Pocket

Here's a book that every worker in tin and sheet-metal should have with him all the time.

It tells at a glance—

How to make all kinds of seams and joints.

How to increase the given diameter of tin and sheet iron.

The weight and thickness of every gauge of sheet iron, from 38 to 0000000 gauge, and of sheet zinc from 4 to 24 gauge.

The difference between wire gauges; weights and thicknesses of sheet copper; net weight per box of tin plates; diameters, circumferences and areas of circles and cylinders from a foot to 12 feet in diameter, and a lot of other mighty valuable information.

Most important of all, it shows every Pexto tool and machine for the metal worker, with a full description of each and an outline of the work it does and the way it does it.

All this information is compressed into a book that just fits the pocket. Write for it now. It's free.

Cut shows Chuck on nosing operation. This is one of over two hundred in this Canadian plant.

This chuck is *built on the duplicate part system. It is simple, effective and fool-proof.*

It grips the shell in a predetermined position. The jaws will not slip on the shell. It has shell interior and exterior adjustable stops.

A trial on one of your lathes will convince you that this is THE Chuck for shell work.

A Big Efficiency Unit in Your Shell Plant

A. J. LAVOIE'S

LOW PRESSURE

Compressed Air Chuck

This chuck can be applied to any make of lathe, without alteration to the machine, and will increase production from 25% to 75%. It grips and releases the shell while in motion—no need to stop your machine.

It is a single unit combination attached to the face plate of lathe, supported by an additional heavy duty bearing, thus making a heavy duty lathe out of a light machine. A small lever operates the chuck. Will operate with a pressure of 60 lbs. per sq. in.

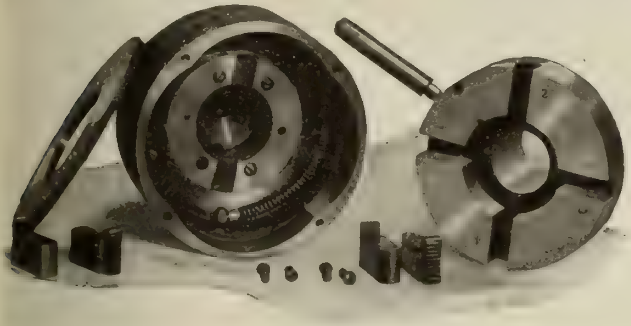
The "IDEAL" Die

for

Shrapnel

Quick, accurate work in threading Fuse Plugs for Shrapnel Shells is essential if you would make maximum profits. Your field is unlimited and your output governs your income. **Why not give the special type "C" Ideal Die a hard trial at this work and see if it will not boost production for you?**

Let the "IDEAL" cut the threads that bind you to low production. They will fit your machines. Circular on request.



"IDEAL" is a *different* die. The head revolves around a stationary cam, thereby utilizing the belt power or cutting strain as opening power. Chasers are supported directly back of cutting strain, which will remove any tendency to bell out and cause taper threads.

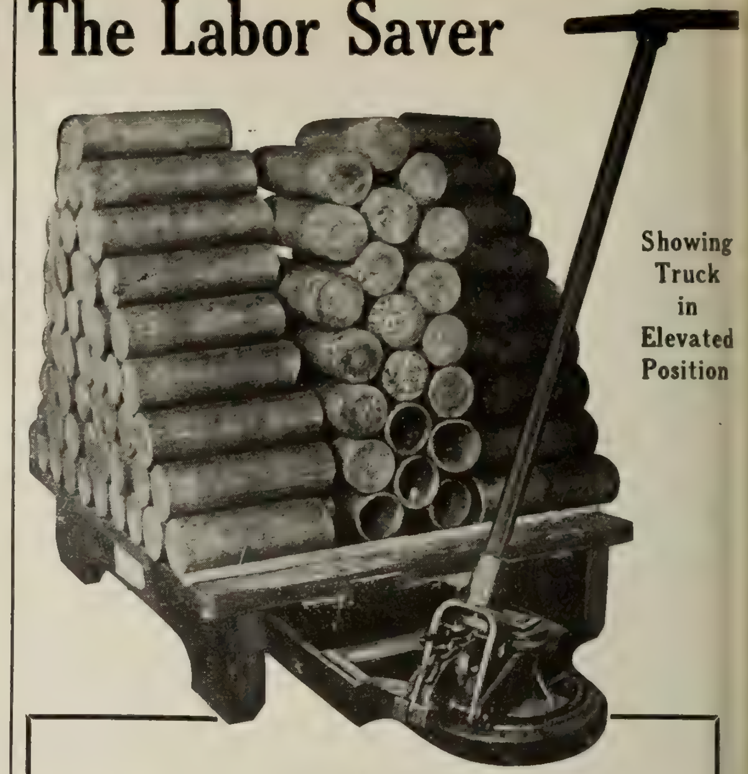
The Labor Saver



Showing Truck in Elevated Position

THIS

ELEVATING TRUCK

greatly reduces cost of producing

SHELLS

or any factory product where numerous operations are required.

All material is stacked on the platforms. To move material the truck is backed under the platform; the handle of the truck is then pushed down, keeping the button depressed, which raises the truck bed, and with it the loaded platform, at the same time automatically locking it in its raised position.

When hauled to the desired position the button is pressed and the handle raised, lowering the platform to the floor. The truck is then drawn from underneath and is ready to move another platform.

Raising and lowering of the truck can be operated with one hand—can be raised or lowered at any angle. Specially designed ball-bearings throughout.

We also manufacture **Loading Funnels, Ball-Bearing Tightening Nuts, Belt-Driven Loading Vibrators, Bench Vises and** PRESSES WITH ATTACHMENTS FOR PRESSING IN BAND — fixtures especially adapted for the manufacture of 18-pr. Shrapnel Shells.

You will profit by getting in touch with us now for prices and full information.

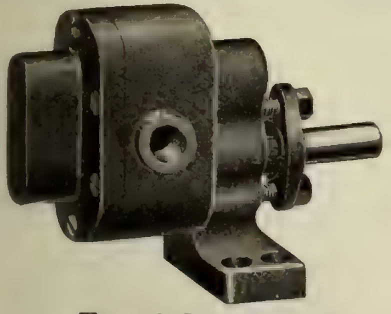
Positive in Action—Simple in Construction



Type 1 One Way

Type 2 One Way

ROPER
Circulating OIL PUMPS

Give a steady, non-pulsating stream delivered in proportion to the speed of the machine.

Type 1 One-way pump is especially designed for use on machines in which the cutting tools operate constantly in one direction, although by belting separately to the pump it may be used on a reversing machine.

In this form of pump a separate relief valve is used in the pipe line if it is desired to close the delivery pipe while the pump is running, or if the delivery is varied in quantity.

Where it is known that the delivery will be cut off or varied at times with the pump running, our **Type 2 One-way pump** provides the best as well as the cheapest way of accomplishing this result.

By using this form of pump, the piping is much simplified and the cost of installing is less while the appearance of the pump on the machine is much better.

It will pay you to investigate Roper oil pumps—they are saving money everywhere.

WRITE FOR FULL PARTICULARS.

C. F. ROPER & CO., HOPEDALE, MASS., U.S.A.

Looking for a safe and easy-running hoist?

Try the

Ford Tribloc

CHAIN HOIST

You may operate the Tribloc at any speed or at any angle, as the Patented Loop Hand Chain Guide prevents the "gagging" of the hand chain and insures a safe and easy-running hoist.

It is 3½ to 1 in its weakest part—the greatest factor of safety of any chain hoist built.

The Tribloc has planetary gearing, steel working parts and drop-forged chains and hooks. It has everything that will increase its efficiency and safety and is so good that we guarantee it for five years.

Our catalogue gives details and prices and illustrates other styles of hoists. Ask for a copy.

FOR PLANERS

WORCESTER LUMBER CO., CHASSELL, MICH.

Magnolia Metal Co., March 23rd, 1916.

Gentlemen:

In my twenty-five years' experience in saw, shingle and planing mills I have used all the principal brands of babbitt metals. After a great many severe tests, I find Magnolia Metal to be superior to all others for all general purposes.

I babbitted the cylinders of one of our planers eight years ago, and the machine has run on an average of more than ten hours per day since, at a speed of 4,000 R.P.M., and will probably run another year or more without rebabbitting.

Yours very truly,
FRED. GRAY.

CANADA'S DEPARTMENTAL HOUSE FOR MECHANICAL GOODS

Machine Shop Equipment, Methods and Processes[*]--II.

By E. R. Norris[**]

Since recent events have demonstrated so strikingly the reliance which must be placed by a nation on its engineering industry as a factor in modern warfare, the subject of the above title assumes a place of importance not previously awarded it by people in general. While not dealing specifically with munitions or other similar product, the application of the principles contained therein may be done with profit in all branches of engineering.

MACHINE tool manufacturers have shown considerable enterprise during late years in dealing with the problems and possibilities presented by the introduction of the new steel. Since greater cutting speeds, feeds and cuts were possible, it became at once apparent that machine tools of greater strength and rigidity, combined with closer speed regulation, were highly desirable. Also, since the cutting speed had been increased, the handling time became of greater relative importance; consequently, machine tools have been produced in which the leading features and improvements are rigid construction, large wearing surfaces, improved means of lubrication, superior balance both in the parts of the machine and in the tool reaction - an increased number of available cutting speeds and feeds, closely graduated indexes, enhanced facilities for simultaneous operation and automatic and semi-automatic time-saving devices. Thus, the selection of the most suitable machine for a specific manufacturing operation has become a matter which requires considerable skill and experience.

Machining With Edge Tools

The selection of machinery for machine shop purposes must depend not only upon the design, size, accuracy and finish required by each class of work, but also upon the quantities which may be manufactured and carried in stock at one time. The following practice, which calls for the use of parting-off machines, centering machines, special rough turning and spotting lathes, cylindric grinding machines and milling machines has been found satisfactory for the manufacture of accurately finished steel shafts, which range in size from 1½ in. dia. (38.1 mm) by 15 inches (381 mm) long to 4½ in. dia. (114.3 mm) by 5½ feet (1.68 metres) long and are manufactured in quantity.

The material from which the shafts are made is hot-rolled axle steel, which has been carefully selected under rigid inspection at the mills. It contains about 0.44 per cent. carbon and 0.55 per cent. of manganese. The ultimate tensile strength must not be greater than 90,000 pounds per square inch (6328 kg. per sq. cm.) or less than 75,000 pounds per square inch (5273 kg. per sq. cm), and the elongation in 2 in. (50.8 mm.) must not be less than 18 per cent. The material is in about 22-foot (6.7 metres) lengths, when received from the mills, and is cut to the desired lengths after arrival at the works, these lengths being usually 1-32 inch (0.79 mm) to 1-16 (1.59 mm) longer than the finished lengths of the shafts. Several kinds of machines are used for cutting this material to lengths. The hollow-spindle cutting-off machine, with its forged steel tools, has been largely abandoned in favor of the revolving-cutter type of cutting-off machine. In the external revolving-cutter type, high-speed steel cutters, which are adjustable, are inserted in the rim of the revolving disk. The machine is provided with a very handy pneumatic clamping device by means of which the work is rigidly and rapidly fixed in position. In another machine, the cutters are arranged around an inner circumference of an annular disk. This machine is built to take stock up to 6 inches (152.4 mm.) in diameter, and the cutting is done by eight inserted high-speed steel cutters. Four of these cutters are round-nosed for roughing and four are square-nosed for finishing, so arranged that each square tool follows a round-nosed tool. The machine is driven by a constant speed motor of 710 revolutions per minute, which gives a cutting speed of 47.6 feet (14.5 metres) per minute. The length of bar stock is conveniently adjusted by means of the hand wheel, rack and gearing, one of the round ways upon which the carriage slides being graduated in feet and inches. A pneumatic clamping device, similar to the one used with the external achine, is also used with this machine. As these machines are used on rectangular and round bars, both external and internal designs are desirable, the latter being more suitable for round stock. Some idea of the relative values of the hollow-spindle cutting-off machine and the internal cutting-off machine may be obtained from the following figures, which were obtained by tests made on 4.75 inch (120.65 mm) diameter by 22.5 feet (6.86 metres) long axle-steel stock.

	6 in. (152.4 mm.) Hollow-Spindle Cutting-off Machines	6 in. (152.4 mm.) Int. Cutting-off Machines.
Cutting speed	64.5 ft. (19.66 metres) per min.	47.6 ft. (14.5 metres) per min.
Feed per min.	0.25 in. (6.35 mm) per min.	2.0 in. (50.8 mm) per min.
Total time on six cuts....	1 hr., 16 min., 10 sec.	33 min.

Centering.

After the shafts have been cut to length they are next centered in a double-head centering machine, which has two self-centering chucks. By this machine, true alignment of centers is secured, and as only one setting is required for centering both ends, this method is quicker than the older method in which a single head was used. Due to rough turning operations, the centers are subject to very heavy stresses, and where the centers are not in alignment these stresses are greatly increased, the centers wear rapidly and the shaft does not run true. This renders necessary an increased allowance of metal for grinding. The centers are drilled with a combination center drill, which drills the pilot hole, counter sinks to 60 degrees and also counter bores the shaft to a depth of 1-16 inch (1.59 mm). As all shafts on one order must have their centers of uniform depth, so that length stops may be used on the lathe, the center drill is provided with a stop.

Rough-turning Shafts for Grinding

The third operation on shafts is that of rough turning and spotting. Shafts from 1½ inch (38.1 mm) dia. by 15 inches (381 mm) long up to 4½ inches (114.3 mm) diameter by 5½ feet (1.68 metres) long may be conveniently rough turned, spotted and threaded in a special lathe. This lathe is equipped with adjustable stops for length and cross feeds, which, after the first setting, render calipering unnecessary and insure uniformity in the spotting for grinding. There are three tools, one for roughing, one for spotting and one for rough cutting the thread. Four cuts are taken with the threading tool, after which an adjustable die head, arranged over the tail-stock spindle and lathe center, cuts the threads to within (0.254 mm) 0.010 inches of the finished size. The thread is brought to size by means of a hand die after all the chief operations have been performed on the shaft; this insures a true thread and corrects any abuse which the thread may have received in handling, while going through the various operations.

Milling Keyways

The next operation is that of milling the keyways. These are milled on a heavy vertical milling machine built for work of this class and provided with a two-fluted end-mill cutter. The cutter or end-mill is held in the spindle of the machine by a draw in collet, run at a high speed and flooded with cutting compound. The shaft is located in the machine by a self-centering device and an end stop. The keyway is then cut by feeding the cutter down to a depth stop by hand, after which the longitudinal feed is used and automatically thrown out by a stop which is set to suit the length of the keyway.

If the ends of keyways are not required to fit round-ended keys, it is found economical to place a number if shafts on "V" blocks and mill them by means of gang milling cutters, which are carefully spaced on the arbor. Where keyways have been cut by this latter method and the design calls for round-ended keys, it is necessary to transfer the shafts to an end-milling machine; and experience shows that it is more economical to complete the operation on one shaft at a time on a vertical machine, because the extra handling and time taken to re-set the work for end milling more than offset the gain made by milling several keyways simultaneously.

Grinding

The final machining operation on the shafts is that of grinding. Satisfactory grinding results can only be obtained by the use of rigid and accurately aligned grinding machines, in which the work is well supported by centers and steady rests, and where due attention has been paid to the grade of wheel, its diameter, width, peripheral speed and also speed and traverse of the work. Careful attention must also be given to the truing of the wheel, if a true and high finish is desired. The method of handling and grinding shafts depends somewhat on their size and the quantities manufactured at one time. On all heavy shafts it is the practice to rough and finish-grind complete the entire shaft before removing it from the grinding machine, except in those cases where the shaft has a taper, in which case the shaft is transferred to another machine to receive the taper grinding operation. In the grinding of heavy shafts, the fits are first ground to size and the journals, or bearings, are rough-ground to approximately .003 inches (.076mm) larger than the finished size, the wheel is next trued up and the bearings finished. In dealing with shafts which may be easily handled by hand, the better practice is to rough-grind journals, grind the fits to size and remove shafts from the machine. After about 50 shafts have been so treated, the wheel is carefully trued up, the shafts replaced in the machine and the journals finish-ground to size .

Milling.

Great advances are being made in milling practice as a result of recent experiments with "stream lubrication." These experiments have shown that cutter and work can be kept cool under very high speeds and feeds by the application of a sufficient quantity of cutting compound. The compound is conveniently and effectively applied to the cutter and work by means of a hood.

Some idea of the importance of "stream lubrication" may be gathered from the following data, which has been taken from various tests. By using stream lubrication while cutting the teeth of a long pinion, it was possible to increase the speed 71 per cent. and to increase the feed 164 per cent. The speed at which keyways in chrome-nickel steel shafts were milled was increased 36 per cent. and the feed 90 per cent. By the same means, the speed for milling the teeth of machinery steel sprockets was increased 86 per cent. and the feed 50 per cent.

Stream lubrication is being used to advantage in cases where, owing to limited capacity of the machine, speeds and feeds cannot be increased. The following is an instance of such a case. In milling grooves to form bars of "H" shaped section, it was possible to mill 300 pieces for each grinding of the cutter—stream lubrication being used—whereas, with the ordinary lubrication, the cutter had to be ground after 15 or 20 pieces.

While stream lubrication gives excellent results on steel of various kinds, it is not aways satisfactory when used on cast iron. This appears to be the case where the hard skin of cast iron must be encountered at all parts of the traverse, as for instance where the cutter is wider than the surface of the casting, and the vertical edges of the casting skin are presented to the cutter at two places only, which are separated by a distance equal to the width of the casting.

Continuous Milling

Since the cutting speeds and feeds have been greatly increased, it is evident that the ratio which the handling time bears to the total time of any milling operation will be greatly increased, unless improved handling and chucking facilities commensurate with the increased cutting capacity be installed. It is also evident that the highest efficiency can be obtained from operator and machine, only when the cutting proceeds continuously. This condition may be obtained, approximately, by what has been called the "continuous" method of operation. The "continuous" method may be used where the work is of such a size and shape that a circular milling attachment or a machine having two or more revolving tables can be used. Continuous milling is employed in finishing the base plates of electric sad irons by mounting them on a circular milling attachment. This circular attachment is provided with 10 independent chucks for holding the castings, thus allowing the operator time to take out the machined castings and put in other castings while the cut proceeds. The efficiency, in this example, may be gauged by the fact that the work was formerly done by one operator on two vertical milling machines fitted with transverse feed, magnetic chuck and high-speed cutters. The output was doubled and 50 per cent. of the floor space saved by the new method.

Double Table Miller

In a comparatively recent machine for continuous milling two tables, which carry the work, revolve about a central column, the revolving and indexing being actuated by means of a foot lever. The operations of this machine are so arranged that the time for setting up the work is equal to or less than the time required to make the cut. Under these circumstances, the only lost time between cuts is 10 seconds, the time required to revolve and index the tables —to which must be added, where the work is short, the time required to traverse the work to and from the cutter at the beginning and end of each cut. As an instance of the saving effected by this machine, may be cited a case where steel keys 9 inches by 1¼ inch wide (288.6 by 31.75 mm), set up two at a time on each table, were milled on both faces in an average time of 3.45 minutes each; whereas the time required to do this work on an ordinary milling machine was 7 minutes each. By mounting 7 pieces on each table, the time per piece was reduced from 3.45 to 1.5 minutes each.

The uses of the spline miller have been extended so as to include curved slots and forms in endless variety, by an ingenious and inexpensive camming attachment. The attachment consists of an angle bracket which is bolted to the plate and carries a supporting roller for the cam. A face plate, or carriage, to which the work is attached slides on the angle bracket, being actuated by a small roller as it travels upon the upper edge of the cam. The pressure between roller and cam is regulated by a spring. One end of the cam is fixed by a tap-bolt to the frame of the machine, the other end being supported by a roller. Straight slots may be produced by fixing the face plate to the angle bracket by means of a wing-nut and stud. This camming attachment has been found remarkably efficient for rounding off the ends of pinion teeth.

Drills and Drilling Machinery

Although the first cost of high-speed drills is much more than that of carbon-steel drills, high-speed steel is now in general use for all drills above 3-16 inch (4.76 mm) diameter; and while carbon steels are frequently preferred for the smaller sizes where the material to be drilled is chiefly brass or cast iron, it will be found economical to use high-speed drills for the small sizes where much steel has to be drilled. There are several reasons why high-speed drills are so generally used, the first of which is undoubtedly their great cutting capacity. Carbon-steel drills are commonly used on machinery steel, with 0.005 to 0.01 inches (0.127 to 0.254 mm) feed per revolution, at a peripheral speed of 20 feet (6.09 metres) per minute, while high-speed drills are ordinary driven at a peripheral speed of 70 feet (21.33 metres) per minute, with feeds ranging from 0.010 to 0.015 inches (0.254 to 0.381 mm) per revolution; and cases are on record where, under best conditions, high speed drills have been used successfully at a peripheral speed of 135 feet (41 metres) per minute, with a feed of 0.06 inches (1.52 mm) per revolution. Another reason why high-speed drills are preferable is found in the saving of grinding time. Still another reason appears in the reduction of the number of drills carried in stock, for, owing to the frequent grindings necessary with carbon-steel drills, operators frequently carried three or four drills of the same size, so as to save the time which would othewise be lost in walking to and from the emery wheel.

Machine Design Revised

As in other machine tools, the adoption of high-speed steel for cutting has been followed by the re-design of the machines due regard being paid to the element of rigidity and the power required to drive new drills to the limits of their capacity. Belt-driven feeds have been largely superseded by spur-geared feeds, and cast iron gears have given place to cut steel and bronze gears. All important bearings are bushed with bronze. Spindles are of forged, high-carbon steel, accurately ground and fitted with ball thrust-bearings, instead of the fibre washers previously used. Automatic time saving devices have received much attention. Attachable multiple-drill heads, having adjustable centers arranged to take 2, 3, 4, 5 or 6 drills, have found many suitable applications. High-speed drills have encouraged the practice of multiple-drilling, and, on repetition work, multiple drilling machines are often arranged to drill complete at one setting. The machine may be arranged for drilling in five or more directions at one time.

WAR-TIME USES OF FOREST PRODUCTS

ONE of the mysteries of the present war, to neutrals and enemies alike, is the source from which Germany obtains the nitrocellulose necessary in the manufacture of smokeless powder, and ordinarily made from cotton. A well-defined belief exists in England that at least part of the nitrocellulose needed by German powder factories is being made from wood. "If this is true," writes A. W. Schorger, chemist of the Forest Products Laboratory at Madison, Wis., "it furnishes another instance of the surprising dependence upon wood, in one form or another, on the part of the fighting nnations. The actual extent to which forest products are put to use in time of war, both for military purposes and for supplying the nation with some of the things it needs to carry on its daily life, is not generally recognized."

Warfare on land has developed in a way to give timber an importance in field operations it never had before, while the vast number of accessories needed for the smooth running of the modern fighting machine, from ammunition to absorbent cotton, have led to an extraordinary demand for certain forest products, and have even brought about new uses for wood born of necessity and unheard of a few years ago.

Black Powder

"For one thing," Mr. Schorger says, "there is the matter of explosives. Ordinary black powders contain about 75 parts saltpetre, 10 parts sulphur, and 15 parts charcoal. The charcoal employed must possess special properties, and is made largely from dogwood, willow and alder. In spite of the advent of smokeless powder, enormous quantities of black powder are still used. It is employed in shrapnel, for which only a moderately powerful explosive is required to drive the bullets. Besides, the smoke produced when the shell explodes is an actual advantage in enabling the gunners to determine the correct range.

Black powder is also used to fill the rings of the time fuses with which shrapnel shells are equipped, for which purpose no satisfactory substitute has yet been found. Furthermore, it is used in most armor-piercing shells, which should attain a great penetration before they go off, and for which the majority of high explosives would be unsuitable because of their explosiveness on contact. Another product of the forest, resin, is employed for filling the spaces between bullets in shrapnel, so that on explosion the missiles will be evenly distributed in all directions. Its brittleness, and at the same time its hardness, together with its low melting point, fit it admirably for the purpose.

Nitrocellulose

The period since the beginning of the war has witnessed a great amount of discussion in England as to whether Germany is actually employing wood from which to make the nitrocellulose for her smokeless explosives. When after a long delay England declared cotton contraband of war, it was maintained by many that this would not inconvenience Germany greatly, since she was already making explosives from wood cellulose. During the discussions that followed it was proposed to destroy the forests of Germany by a giant fleet of aeroplanes armed with bombs; however, as one English editor naively remarks: "This would scarcely be feasible, since about one-third of Germany is forested."

"As a matter of fact, little or no reliable information exists in regard to Germany's use of wood for nitrocellulose, and expert opinion in England differs widely about the matter. Sir William Ramsey believes that such explosives are being made, and Walter F. Reid, who introduced the important gelatinization process in the manufacture of smokeless powder, is emphatic that a nitrocellulose can be made from wood pulp that is equal in every respect to that made from cotton. On the other hand, Clayton Beadle, whose opinion is entitled to great respect, holds that the difficulties attending proper purification of the wood cellulose previous to nitrification are all but insurmountable.

"However, this may be, records published by German scientists before the war show that a high explosive can be manufactured from wood cellulose, though at that time its stability was questionable. While it required forty years of experiment to render guncotton stable, anything like the same time might not be necessary in the case of wood cellulose, for the experience with guncotton should facilitate solution of the present problem. It is highly probable that the chemical difficulties have already been overcome."

Turpentine and Rosin

The long leaf pine forests of the South furnish 90 per cent. of the world's supply of turpentine and rosin. In normal times turpentine is used mainly as a solvent in the arts. According to Mr.

Schorger, it is entirely possible, however, should the need arise, to make from turpentine a synthetic camphor as good for practical purposes as the natural product. In the event of the blockade of the Pacific Coast this should be the means of preserving our celluloid industry, which now consumes the greater part of the 5,000,030 pounds of Japanese camphor imported annually.

Rosin, the use of which in shrapnel has already been mentioned, is employed mainly in the manufacture of cheap soaps and as a size for paper. So acute has become the scarcity of rosin in Germany that the Prussian Minister of Agriculture has suggested such measures for increasing the supply within the empire as distilling resinous wood and collecting the oleoresin which exudes from trees peeled by deer. Prices being paid for rosin by the Central Powers are almost fabulous. Curiously enough, a substitute for paper size recently proposed by a German scientist has wood tar as its base.

* * *

MEETING WAR EXIGENCIES.

THAT Germany is not the only belligerent country that has devised new means of meeting the exigencies of war is shown in a report from the American Counsul, at Bradford, England, who says that English manufacturers have found many ways of providing articles made extremely scarce because of war demands. Artificial leather, a good substitute for leather; artificial silk, various fuel oils, wood pulp for many uses to which cotton was formerly supposed to be alone suited, and new means of recovering rubber from waste rubber goods are some of the extensively developed materials and processes.

Scientific research and invention have been most active in Great Britain since the war began, the consul says, and many substitutes have been found for articles hitherto regarded as practically indispensable. Many of the imported aniline dyes have been supplanted by home-made dyes that were formerly entirely neglected. The production of alcohol from wood pulp has started up and wood pulp is also being employed in silk weaving where before cotton was used. The British are now beginning to make kerosene engines to take the place of gasoline engines, and there is a considerable use of benzol in lieu of gasoline.

One of the interesting substitutes is artificial leather. Linen duck is coated with varnish, to which is added a small quantity of siccative and Venetian red. Several layers of the dried linen are then joined together in sheets of varying thickness. The adhesive mixture used for this purpose consists of four parts of heated wood tar pitch, with the addition, during constant stirring, of two parts of India rubber dissolved in benzol, four parts of Venetian red, mixed to a thick consistency, with French turpentine oil and two parts of cork powder. Sheets thus prepared are compressed between powerful rollers. The product, it is claimed, serves as an excellent substitute for leather, especially for the soles of footwear. It can be easily sewn and pegged, and can replace leather in many of its uses.

* * *

THE MUNITIONS PROBLEM

ACCORDING to the *London Iron and Coal Trades Review*, experiences in America have brought forth the conservative estimate that it would take fifty engineers, designers and draughtsmen at least one year to prepare the drawings for the seventeen sizes of shell now used by the United States army, together with drawings for gauges, jigs, fixtures and tools. To produce the latter would take 800 men, well trained and in well-organize factories, at least five years, calculating 300 working days per year. This, it is estimated, would find employment for 100 factories, each employing 2,000 men, capable of producing a total output of 200,000 shells per day. Twice this number of shells have been used in a single day in the present war by one of the combatants. It was found in America that it would take at least 300 first-class gauge makers six months to furnish the first working set, inspector's set and the master's set necessary for rifles in quantity, and when 1,000 rifles per day are required it means that the working sets must be increased from one to ten, and the inspector's set from one to five, keeping the maser's set for reference purposes. It is believed that in the United States there are not more than 3,000 expert gauge makers. Toolmaking, jigs, fixtures, etc., require a small army. It is calculated that it takes at least 1,000 toolmakers one year to furnish tools for an output of 1,000 rifles a day, and it may be estimated that to put 1,000,000 men in the field requires from 2,000,000 to 3,000,000 rifles.

* * *

SCARCITY OF WOOD PULP

THE News-Print Manufacturers' Association reports that the pulp wood situation in Canada is ominous. Mills which were paying $18 and $26 a month, with board, to ordinary workmen in the woods last year, are now competing with one another for an adequate supply, and are offering from $55 to $60 a month with board, and camps in many cases are not supplied with a full complement of men. There is every probability that the cost of pulp wood will advance very sharply this year as compared with the pulp wood costs of the past, but the chief source of worry will not be the high cost of pulp wood, but the possibility that the mills may not be able to secure a sufficient supply to provide for their requirements during the whole of the year 1917. Statistics showing the production and shipments follow:

	Production,	Shipments,	Stocks,
Week ending	p.c.	p.c.	tons.
Sept. 16...	102.2	104.7	1,323
Sept. 23...	83.2	83.4	1,376
Sept. 30...	106.2	107.6	1,181

The heavy decrease in production and shipments for the week ended September 23 was largely caused by labor trouble at a large Western mill, and by the fact that a number of the smaller mills were running on other grades of paper. The report for the Canadian territory follows:

	Production,	Shipments,	Stocks,
Week ending	p.c.	p.c.	tons.
Sept. 16...	99.5	105.4	8,090
Sept. 23...	96.3	100.8	2,405
Sept. 30...	95.6	90.9	2,852

BIG DEVELOPMENT IN SHIPPING SERVICES

ACCORDING to a news agency telegram from Glasgow, Scotland, it is stated in well-informed circles there that important negotiations are taking place with a view to a big development of shipping services between the Old Country and Canada. A "regrouping" of the shipping companies is probable, and will, it is stated, "affect the C. P. R., the Allan, the C. N. R., and the Cunard lines."

Early in this month it was pointed out in the London *Times* that the Anchor Line was understood to have acquired an interest in the passenger ships of the Donaldson Line, which trades to Canada, and it would seem likely that this development has given rise to the present report. The interest in this transaction was enhanced by the fact that the Cunard Company holds a controlling interest in the Anchor Line, and that a few months previously the Cunard had concluded a far-reaching agreement with the C. N. R., and had acquired the vessels owned and controlled by that company.

The C. P. R. now owns the Allan Line, the vessels of the two companies being managed by the Canadian Pacific Ocean Services (Limited), and the White Star Line is associated with the Dominion Line as being joint subsidiaries of the International Mercantile Marine Co. of New Jersey. The passenger lines in the Canadiann trades may, therefore, be separated into three principal groups, as follows:— Canadian Pacific and Allan Line; White Star and Dominion; Cunard, Anchor, Canadian Northern and Donaldson.

The Cunard has gradually been extending its trade with Canada since it acquired the Thomson Line in 1911.

PRODUCTION METHODS AND DEVICES

A Department for the Interchange and Distribution of Shop and Office Data
and Ideas Evolved from Actual Practical Application and Experience

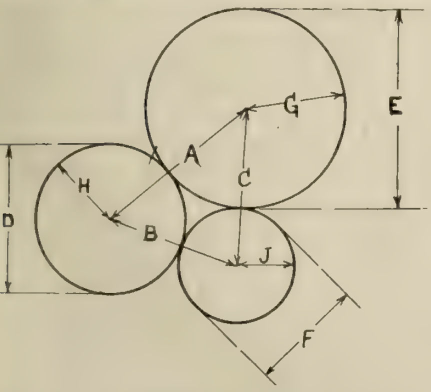
METHODS OF MEASUREMENT FOR EXPERT MECHANICS—II.

By F. Scriber

At the beginning of the previous article attention was drawn to the possibility of error resulting from the dimensioning of a drawing being done in one way and the actual measuring of the piece being done in another way. To prevent loss of time and remove any possibility of error on the part of the shop, dimensions should always be put on a drawing in the same way as the piece will be measured.

For certain purposes of calculation it may be necessary to put on a dimension which cannot be measured in the shop, and, where a high degree of accuracy is required, dimensions which are quite impracticable are frequently employed as shown by Fig. 15.

Impracticable Dimensions



These dimensions are usually the result of a draftsman having a fixed point on a layout from which to work, coupled with the fact that when detailing the parts the dimensions are given from this point without regard to the fact that this point is "out in the air," and cannot be used to measure from. Referring to Fig. 16, the illustrations are shown with the proper dimensions from which all measurements may be taken from within the part itself, thus permitting the work to be checked after laying out as well as facilitating the work of laying out. These two plans of working dimensions differ chiefly from the fact that in Fig. 16 construction holes X are used from which the various locations are obtained, while in Fig. 15 it is not possible to take scale measurements in many cases. Referring to Fig. 15, locating plate, it is obvious the slot A cannot be located accurately from the point B. thus the method of locating in Fig. 16, with dimensions C and D is the better way. Likewise the radius E, Fig. 15, is less likely to be correct if dimensioned as in Fig. 15, than if dimensioned as in Fig. 16, where all measurements may be made in a vertical or horizontal plane by holding a plug in the radius E. The view of the test plate, Fig. 15, is a good example of dimension lines given from "nowhere," as the centre line F cannot be used to measure from with instruments and the centres G and H are out in the air and cannot be used; therefore, if good work is expected some other form of measuring must be resorted to, and the method shown by Fig. 16, with construction hole X, provides an accurate method of measuring this piece.

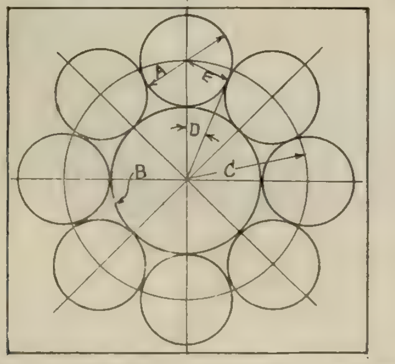


FIG. 17.—UPPER: LOCATING THREE HOLES BY DISCS. LOWER: LOCATING EQUALLY SPACED HOLES BY SAME METHOD.

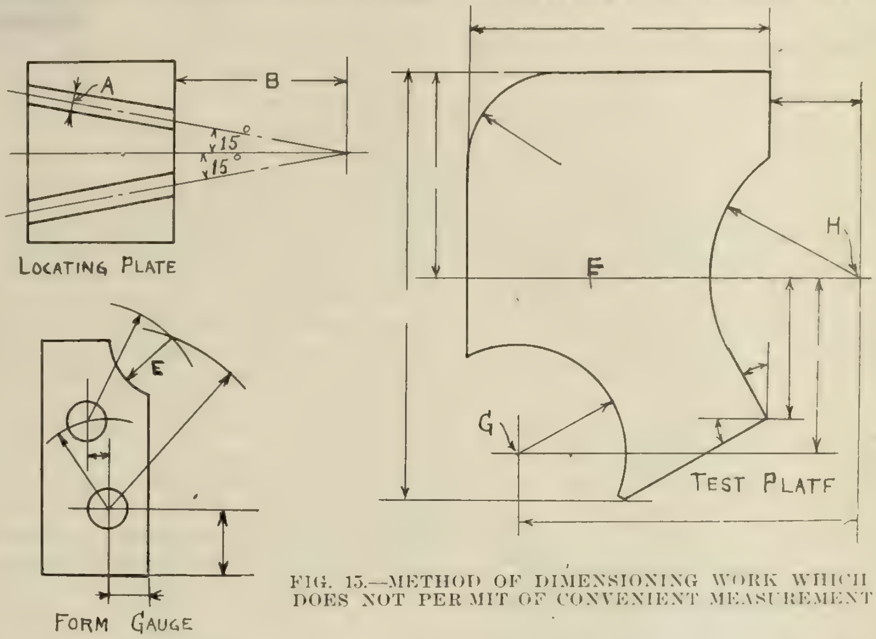

FIG. 15.—METHOD OF DIMENSIONING WORK WHICH DOES NOT PERMIT OF CONVENIENT MEASUREMENT

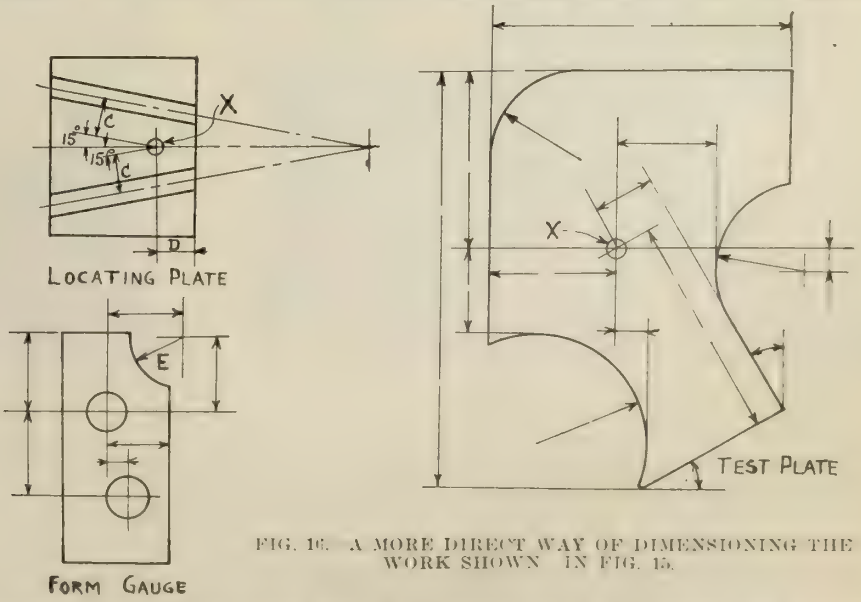

FIG. 16. A MORE DIRECT WAY OF DIMENSIONING THE WORK SHOWN IN FIG. 15.

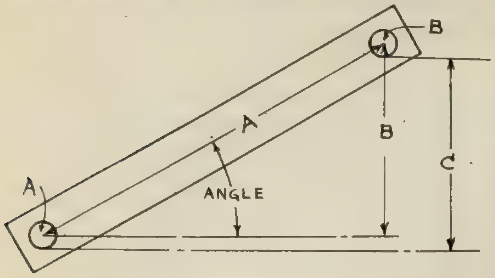
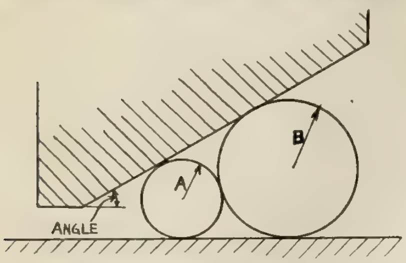
Applying the Disc Method to Boring

The disc method of laying out work

for boring is now quite generally understood, and is illustrated in Fig. 17, upper view, where, having radius A, B and C, it is desired to determine the diameters



B = A × Sine of Angle.
B = C when the pins are the same diameter.



$C = \frac{1}{2}$ angle, $X = B - A$

$$X = \frac{2A \times \sin C}{1 - \sin C} \text{ or}$$

$$X = \frac{2B \times \sin C}{1 + \sin C} \text{ or}$$

FIG. 19.—TWO METHODS OF MAKING ACCURATE ANGULAR MEASUREMENTS.

of discs which, when touching each other, give the desired centre distance. This is obtained by using two discs D and E whose radii equal A when by supplementing these discs with a third disc F, of a diameter which will make the radii B and C, the centres are accurately located. The diameters of discs are found by the following formula: A—B equals difference between radii of discs E and F. Adding this difference to C, we obtain diameter of disc E, E÷2 equals G, A—G equals H, and likewise D—B equals J.

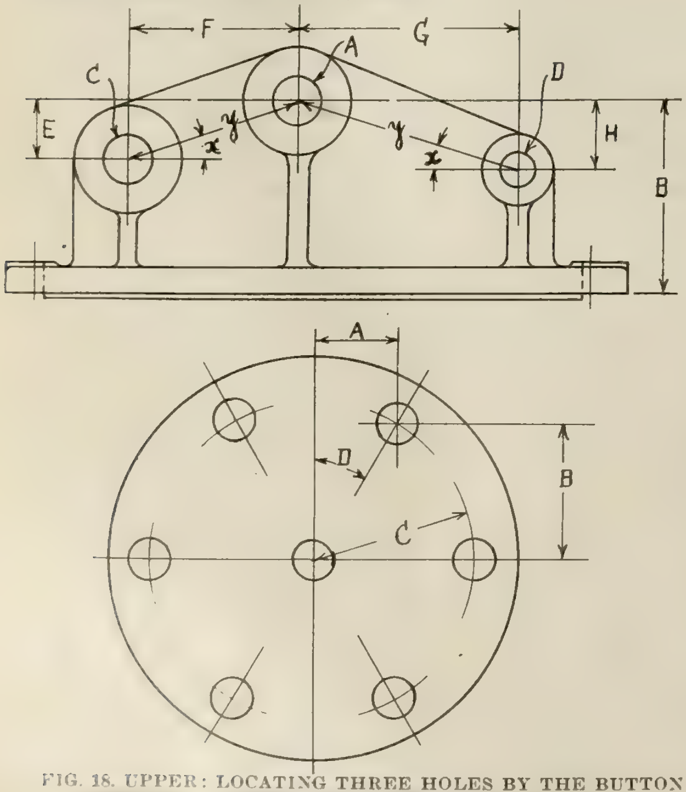


FIG. 18. UPPER: LOCATING THREE HOLES BY THE BUTTON METHOD. LOWER: LOCATING HOLES RADIALLY BY THE USE OF BUTTONS.

In the lower view, Fig. 17, is illustrated a disc method of laying out a number of equally spaced holes, which is easily applied and consists of a number of discs A in contact with a central disc B, and in contact with each other, these discs to be of such a diameter as will bring the centres of the small discs on the radius C. The radius of these discs is found by dividing twice the number of discs or spaces into 360 degrees, which gives the angle D. Having hypotenuse C and angle D using formula—C×cotan of angle = E—the radius of disc A is obtained, and subtracting this from radius C gives radius of disc B.

The disc method does very well for small precision work; while for work of large radius the button method, Fig. 18, is used, which is an adaptation of the disc method, using adjustable buttons in place of discs, and setting these buttons the correct distance apart with the aid of a vernier height gauge or other suitable measuring instrument. In the upper view, Fig. 18, the hole A is first located using dimensions B, following which holes C and D are located using dimensions E, F, G and H, and measuring between the buttons in a vertical or horizontal plane instead of to centres as the dimensions are given. The vertical and horizontal measurements are preferable to the angle X and radius Y on this class of work to insure accuracy. The method of locating centres shown by the lower view, Fig. 18, is obvious, as square figures A and B are given in preference to radial C and angular D.

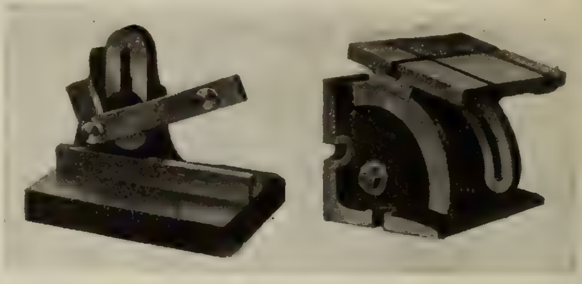

FIG. 20. LEFT: COMMERCIAL SINE PROTRACTOR ON BASE. RIGHT: ANGLE IRON AND SWIVEL TABLE FOR SETTING WORK ON.

The Sine Protractor

As in an article of this type, which is intended to be suggestive, it is not desirable to go deep into the actual method of figuring the problems illustrated, it is assumed that the reader is familiar with the methods of figuring angles by trig-

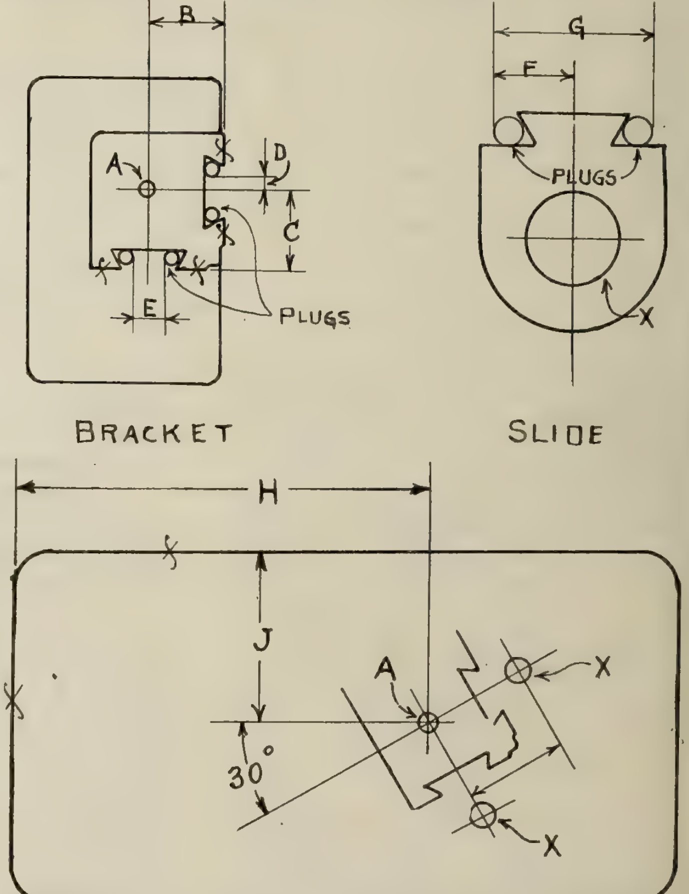

FIG. 21. ARRANGEMENT OF PARTS TO BE ACCURATELY ASSEMBLED.

onometry, upon which the solutions of these problems depend, or can obtain this information from a handbook. In line with this intention note is made of the use of sine protractors for measuring angles, as illustrated in Fig. 19, upper view, with the formula there given for figuring. In the lower view is a formula showing the method of using discs in contact to measure or set up a given angle, this method being in general use, and having been described in some of the late mechanical handbooks.

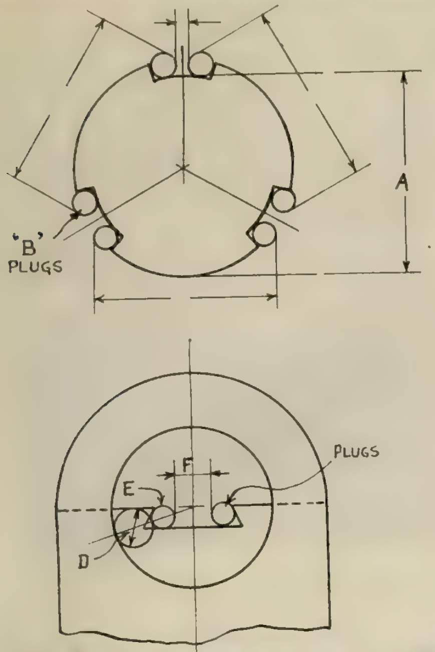

FIG. 22.—UPPER MEASURING THREE GROOVES WITH PLUGS LOWER: LOCATING SLIDE FROM HOLE BY SAME METHOD.

To illustrate the principle on which sine protractors work, reference is made to Fig. 20, which shows at the left a commercial sine protractor mounted on a base, with buttons whose difference in height from base is measured to obtain the angle. At the right, Fig. 20, is shown a convenient angle iron and a swivel table for setting up work at an angle while measuring or machining.

Quite an interesting application of measuring from a construction hole is illustrated in Fig. 21, which also shows the making of dovetail measurements by the use of plugs. In the upper view at the left is shown a bracket, and into this bracket are fitted two slides, as shown at the right upper view. This bracket with the slides is to be accurately located on the base shown in the lower view. To accomplish this result a construction hole A is placed in the bracket, being located from the finished surfaces maked f, as indicated by the lines B and C. With these finished surfaces the two dovetailed grooves are measured by means of the dimensions D and E. The two slides are also measured by means of plugs using dimensions F and G. Again making use of the construction hole A, the bracket is located in position on the base, using the dimensions H and J. Following this, the holes in slide X are accurately located from the construction hole, thus assuring a good job, any part of which may be duplicated by actual measurements without recourse to the common method of fitting the parts together each time any part is made.

Groove Set-up

A set-up used for measuring grooves is illustrated by Fig. 22, upper view. The method of procedure in this case is obvious, as the depth of grooves is first measured, as indicated at A, following which plugs B are set in the grooves and measurements are taken, as indicated by the dimension lines. In the lower view, Fig. 22, it is necessary to locate the dovetail slide in relation to the hole, and this is accomplished by testing with standard plugs D between a plug E held in the angle of slide on one side; measuring between the two plugs in the angles across F indicates whether the width at dovetail is correct.

From these illustrations it is hoped some idea of how to execute various jobs may be obtained when a high degree of accuracy is necessary, but it might be well to bear in mind that much of the work commonly met with in the shop does not require attention to the minuteness of detail which these set-ups show, and it often happens that some simpler and quicked method can be applied which is satisfactory. This, however, is a matter which calls for individual judgment, and no amount of descriptive methods can cover the numerous departures from these examples which will suggest themselves to the wide awake tool-maker.

INCREASING PRODUCTION

By S. M.

IN the belief of many managers the productive capacity of their shops are limited if their equipment does not happen to be of the very latest type. Their machines may have done good service in days gone by, yet because they are slightly antiquated, the feeling prevails that operations must be performed in the same old time-killing manner. When high speed steel became a reality and an acknowledged success, many superintendents failed to see the advantages accruing from its use. The writer has in mind one such shop which uses at the present time only a very few high speed drills. Although a large bulk of replacements are made with drills of the high speed variety, yet the management cannot see the advantage of discarding the old drills and putting in an entirely new stock, which would prove in a short time an exceedingly profitable investment.

As matters now stand, a compromise is made on feeds and speeds by the operators with a consequent lowering of efficiency. In fact, many of the users of drills about the shop are unacquainted with the use of high speed drills, due to the small number used, and they consequently know but one speed. No doubt in many other manufacturing institutions the same problem exists, especially those of the smaller variety, and which have been in operation for several years. However, where such conditions prevail, it is possible by a proper study of the conditions to sufficiently add to the equipment as to make a decided improvement in the results obtained. Sometimes it is possible

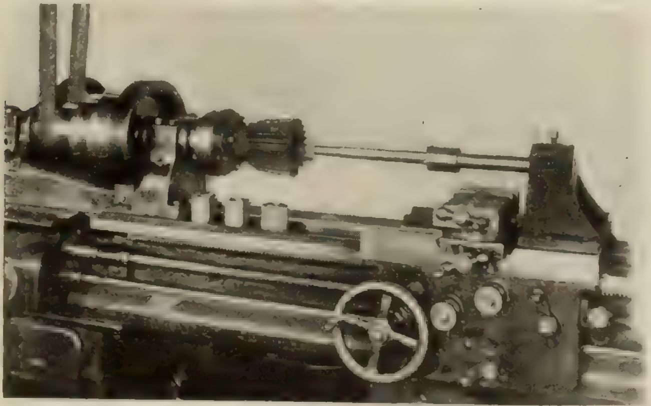

FIG. 1.—SPECIAL TOOLING ON ENGINE LATHE FOR BORING AIR COOLED ENGINE CYLINDERS.

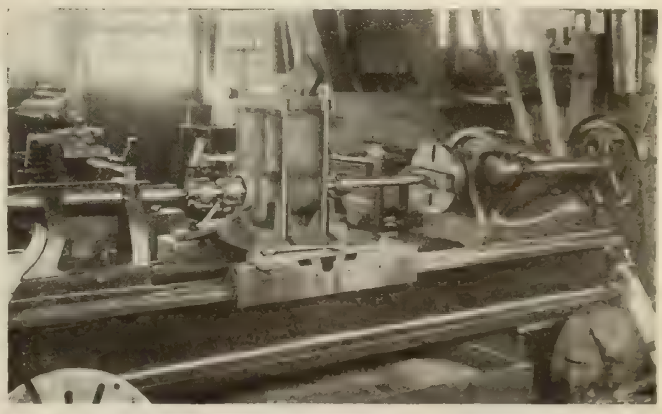

FIG. 2. BORING ENGINE CYLINDER COMPLETE AT ONE OPERATION.

by the addition of very simple fixtures to materially increase the production of any tool. One of the principal differences between the machine tools of today and those of several years ago lies in the fact that the numerous changes of tools are eliminated. Of course, the machines themselves are made considerably heavier, enabling heavier cuts to be taken, but, leaving this consideration aside, the main feature lies in the elimination of unproductive movements on the part of the operator.

The object of this article is to point out one or two instances of increased production as applied to the engine lathe. In any machine shop the most used machine tool is the lathe, and that on which the greater part of the operations are performed. Fig. 1 shows the operation of boring and facing air-cooled cylinders used on small gasoline engines. The original method of doing this job had been to chuck the piece and bore it out with the ordinary boring tool, after which it was reamed, using the tail stock for feeding the reamer through the piece. While it was not possible to do this job on a turret lathe, an effort was made to reproduce conditions there existing, and the same was done with a remarkable degree of success, as evidenced by the increased production. A heavy bridge was placed on the carriage, being dowelled in position and then bored out to receive a boring bar, this bar being also guided by a bushing in the spindle. A fixture was also made for the spindle to which the cylinders were bolted after first being faced on that end. The boring heads were made a loose fit on the bar and were driven by a pin through same. When one cut was taken through the cylinder, the carriage was run back and one head removed by hand and another slipped on. The operation of changing heads practically occupied no more time than that of indexing a turret. After the roughing cuts were taken through the cylinder, the reamer was slipped on the end of the bar, this being tapered to receive it, the final reaming cut being run by hand.. The end of the cylinder was faced, using the cross slide, the tool post having been removed in the cut.

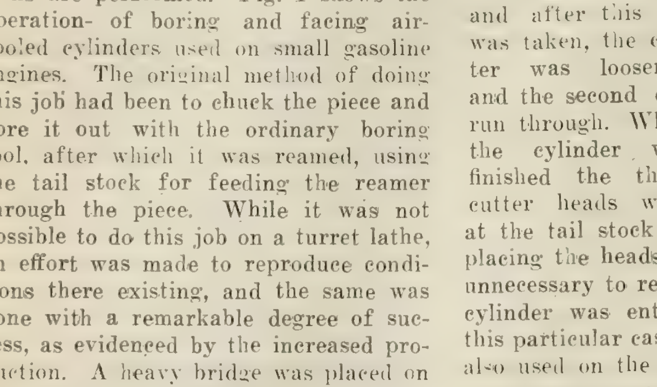

FIG. 4. TAILSTOCK WITH POWER FEED FOR BORING WHILE FACING IN THE REGULAR WAY.

In Fig. 2 is shown a different type of cylinder, which was also used on a gasoline engine. In this case the cylinder was fastened directly to the carriage; the boring bar being made sufficiently long so that the three cutter heads could be slipped on one end of the bar. One of the heads was then held to the bar by a pin, and after this cut was taken, the cutter was loosened and the second one run through. When the cylinder was finished the three cutter heads were at the tail stock end of the bar. By placing the heads all on the bar it was unnecessary to remove the bar until the cylinder was entirely completed. In this particular case a balanced drive was also used on the bar.

In Fig. 3 is shown the small amount of equipment which was used to increase the production of piston rings. The cut shows a ring casting or pot being turned both inside and outside, as well as being made eccentric at the same time. The only equipment in this case was a flat plate, the boring bar, and the inside tool holder, costing in the neighborhood of $15 or $20. This equipment saved something like $350 in the first year of its use over the previous method which had been in operation for a considerable length of time.

In Fig. 4 it was desired to do boring and facing at the same time, and to accomplish this end a power feed was arranged at the tail stock end for a boring bar. A bicycle sprocket was placed just inside the hand-wheel, and could be rigidly connected to same by merely slipping through a pin. Roughing and finishing cutters were provided for the bar for the different jobs. It will be noticed that by this method the carriage is left entirely independent of the bar.

The above instances are merely given to show what can be accomplished along the lines first mentioned, and while they apply to but one type of machine tool, yet they are representative of what may be worked out in almost any small shop, and, with the proper amount of attention given to the equipment, there is no doubt but what greater efficiency may be obtained in the majority of cases. As competition is very keen along any of these lines, it behooves the manufacturer to take advantage of every opportunity of increasing his production, and consequently lowering the cost of same.

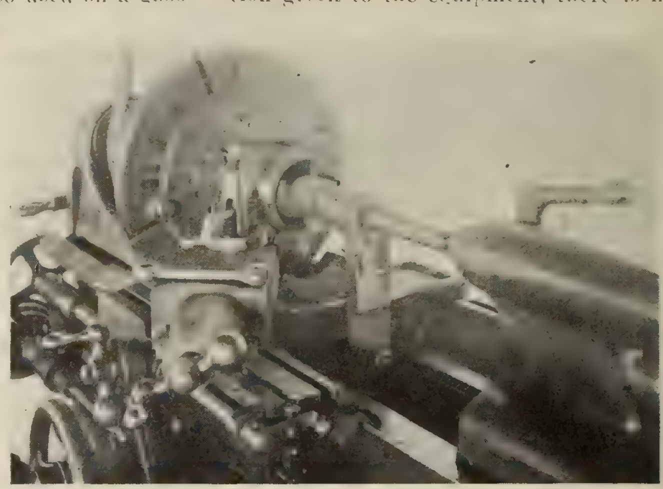

FIG. 3. EQUIPMENT WHICH INCREASED PRODUCTION OF PISTON RINGS.

SQUARING A SMALL DIE

By J. H.

IN the making of small dies for sheet metal work, it is sometimes desirable to have a small square that will permit the blade to enter the opening. It is sometimes difficult to use a flat-bladed square, owing to the inconvenience experienced in gauging the various faces of the die. A very simple, yet serviceable device is shown in the accompanying sketch, where A is a flat block of cast iron and B a small piece of stub steel driven into a hole in the centre of the block. This short piece of steel is first carefully squared with a small try-square and when the die is placed on the block with the steel pin in the opening, all faces can be accurately gauged with very little trouble. Where the die is very small, marking the steel pin is often an advantage.

MACHINISTS' INSTRUCTION COURSE—VIII.

To be able to correctly turn a shaft the right size for a working or running fit, or bore out a wheel or brush a running fit, with the aid of calipers only, depends entirely upon the skill and judgment of the workman. While the following rules are by no means a perfect guide under all circumstances, they have been found to give general satisfaction and will no doubt prove of value to many. The following table shows the amount one leg of the inside calipers should swing inside the hole, when the other leg is resting on the side for a running fit.

Dia. of hole Inches	Swing of Calipers Inches

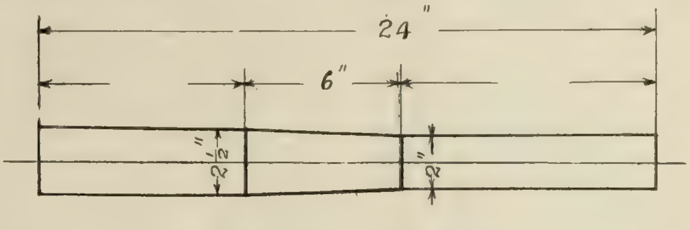
Driving Fits

The allowance for driving fits depends upon a number of circumstances such as the length of the hole, as in a long hole there is more bearing surface than a short hole, consequently the outside diameter of the driven piece can be made a little less. The diameter of the work, the smoothness of the surface, the nature of the metal, and the thickness to resist bursting must all be taken into consideration, so that it is impossible to lay down definite rules. It is in this class of work that experience counts. Generally speaking, if the hole and the shaft are made exactly the same size up to about 6 ft. you will have a pretty snug driving fit. Always oil the surfaces, as it may happen that the fit is a little too tight and if you want to take it out to ease it a little after you have been driving two dry surfaces together, it may give you a lot of trouble.

Making a Forced Fit

The allowance for forced fits is a little more than for driving fits, the main things to take into consideration being the same as have just been mentioned for driving fits. One firm of engine builders allow for forcing on crank pins, one-quarter of a thousandth for every inch in diameter up to 8 in. In fitting car wheels and axles it is generally specified that they shall go together with a certain pressure from 20 to 30 tons. Most firms specify exactly the amount to be allowed on their particular class of work; a 20 to 30-ton fit on a wheel and axle requires an allowance of about .008 in.

In calipering shafts or axles, the amount of difference is not always measured, a snap or limit gauge being sometimes used, or the calipers may be set—the insides to the exact size of the hole, and the outsides to the exact size of the insides, then by letting the outside drag over the work a fairly accurate estimate can be made of the force required to make the fit according to the length of the drag on the outsides.



½" TAPER IN 6 INCHES
FIG. 31.

Shrink Fits

A shrink fit refers to the method of putting two pieces together, usually by heating the metal around the hole, thereby causing it to expand, then putting the piece it is to be shrunk on to through the hole, and allowing it to cool and contract on to the axle or shaft, or whatever it may be. A good rule is to allow .003 in. for the first inch and 1½ thousandths more for every inch up to 20 in. diameter.

Amount of shrinkage for locomotive tires adopted by the American Railroad Master Mechanics' Association:—

38"	or	less	amount	of	allowance	.040

Taper Work

There are at least three different ways of turning taper work between the centres of a lathe. Each method has its advantages and disadvantages, while to a great extent the choice of one or other of the methods depends upon the work in hand. The first method is by setting over the tail stock spindle or dead centre out of line with the live centre. There are usually graduations on the back of the tailstock with a zero mark indicating when the lathe is cutting parallel. If there are no graduations or reference marks, make one with a fine chisel, then the amount that the tailstock is set over can be measured with a scale.

In order to use this method it is necessary to figure out the amount of taper per ft., or per inch, whichever is the most convenient, and compare it with the length of the job, or else assume that the work is one continuous taper from end to end. Suppose, for example, we had a taper to turn according to sketch, Fig. 31. Here the taper is ½ in. in 6 inches, or 1 inch per ft., but the total length of the job is 3 ft. and if we assumed the taper was continuous from end to end of the job, we should have 1 inch taper per ft. for 3 ft., which would be 3 inches of taper, or that we should have to set the tailstock over 1½ in., which is half the amount, because, when the tool cuts into the work, say, ¼ in., it makes the job ½ in. less in diameter, because you take ¼ in. off each side. Setting over the tailstock is most convenient when the job is a long one and the taper is slight.

Objections to Tailstock

The objection to setting over the tailstock is, that the centres are not in line, therefore they wear unequal and uneven, and the part that is taper is very apt not to run true with the part that is parallel. If a number of pieces of different lengths were to be turned the same taper, the lathe would have to be reset for each piece; and even if they were the same length, if the centers were not all drilled to the same depth it would make an appreciable difference. Another way in which the lathe may be set for turning taper, is to turn a small portion at one end of the taper to the small size, and another portion at the other end of the taper to the large size. Then run the tool backward and forward between the narrow strips that are turned, and adjust the centres until the tool exactly touches both ends, in the same manner as has already been described in testing the lathe for turning parallel. This method is equally adaptable for setting over the tailstock or the compound rest. Tapers can be turned by hand by swinging round the top slide of the compound rest. This is the best method for short, abrupt tapers, and it would greatly facilitate matters for the lathe hand if draughtsmen would give tapers in degrees and state amount per ft. in addition to giving dimensions; then the lathe hand would have nothing to do but put his rest round to the degrees indicated on the drawing.

The following table of tapers and angles will be found useful in connection with lathe work:

Taper per ft. Inches	Angle with Centre Line Degrees	Minutes
1/8	0	18
3-16	0	27
1/4	0	36
5-16	0	45
3/8	0	53
7-16	1	02
1/2	1	11
9 16	1	21
5/8	1	30
11 16	1	39
3/4	1	47
13-16	1	56
7/8	2	06
15 16	2	14
1	2	23
1 1/4	2	59
1 1/2	3	34
1 3/4	4	10
2	4	46
2 1/2	5	57
3	7	08
3 1/2	8	18
4	9	27
4 1/2	10	37
5	11	46
6	14	03

If measured with micrometers, the allowance below standard for running fits up to 6 in. is as follows:

Dia. of hole Inches	Allowance Inches
1/2	.0015
1	.002
2	.0025
3	.00325
4	.004
5	.005
6	.006

READER'S QUERY SOLUTIONS

ON page 392 of October 12 issue appeared a reader's query, by F. L. L., for the finding of the values of x and y, in the equation $A = B \times x \times y$, where A and B are known quantities, and the ratio of x to y is as $3\frac{1}{2}$ to $2\frac{1}{4}$.

From the equation $A = B \times x \times y$ we obtain $x \times y = \frac{A}{B}$; therefore, as A and B are known, and the value of x and y are relatively known, a factor common to x and y must be found to solve the equation. Let this unknown factor be represented by Z, and as an example let A = 100 and B = 10; then using the relative values of x and y, the equation will be $A = B \times xz \times yz$, and transposing we obtain $xz \times yz = \frac{A}{B}$, or

$$Z^2 = \frac{A}{B \times x \times y}$$; then by using the various values, we have

$$Z^2 = \frac{100}{10 \times 3.5 \times 2.25} = \frac{1}{.7875} = 1.2698$$

$$Z = \sqrt{1.2698} = 1.1267.$$

As this is the factor common to both the relative values of x and y, the actual values of these terms will be

$xZ = x \times 1.1267 = 3.5 \times 1.1267 = 3.94$ for x, and

$yZ = y \times 1.1267 = 2.25 \times 1.1267 = 2.54$ for y.

To prove the equation with these values we have $A = B \times x \times y = 10 \times 3.94 \times 2.54 = 100.076$. This value is a little large owing to the cutting off of several decimal places. The solution is, however, obtainable by using ehe relative values of x and y as known quantities, and solving for an unknown factor, common to both, that will alter their values, and still retain the desired ratio.

J. R.

* * *

IN a recent issue, F. L. L. addressed a query regarding the value of x and y in a given equation.

The solution which is quite simple is as follows:—

$$\frac{7x}{2} = \frac{9y}{4}$$

$$y = \frac{9 \times 2}{4 \times 7}x = \frac{18}{28}x = \frac{9}{14}x$$

The given equation will thus give us the value of x in terms all of which are known.

$$A = B \times x \times y = B \times x \times \frac{9}{14}x$$

$$14A = 9Bx^2$$

$$x^2 = \frac{14A}{9B}$$

$$x = \sqrt{\frac{14A}{9B}}$$

and as y is $\frac{9}{14}x$, $y = \frac{9}{14}\sqrt{\frac{14A}{9B}}$

To verify this, let us suppose that A = 5040 and B = 10.

Then $x = \sqrt{\frac{14 \times 5040}{9 \times 10}} = \sqrt{784} = 28$

and $y = \frac{9}{14}$ of $28 = 18$

Thus, $5040 = 10 \times 28 \times 18$, which is a verification of the equation

$$A = B \times x \times y.$$

A. M.

* * *

REPLYING to query by F. L. L. in issue of Oct. 12, the following solution is submitted:—

$A = B \times x \times y.$

Ratio of x to y = $3\frac{1}{2}$ to $2\frac{1}{4}$.

$x : y :: 14 : 9$

$x = \frac{14}{9}y$ (a).

and $y = \frac{9}{14}x$ (b).

By substituting (a), we have

$$A = B \times \frac{14}{9}y \times y$$

$$9A = B \times 14y^2$$

$$y^2 = \frac{9A}{14B}$$

$$y = \sqrt{\frac{9A}{14B}}$$

In case (b) we have

$$A = B \times x \times \frac{9}{14}x$$

$$14A = B \times 9x^2$$

$$x^2 = \frac{14A}{9B}$$

$$x = \sqrt{\frac{14A}{9B}}$$

To prove the foregoing:—

Assume A = 1260 and B = 10. Then

Then $A = 10 \times 14 \times 9 = 1260$

(a). $y = \sqrt{\frac{9 \times 1260}{14 \times 10}} = \sqrt{\frac{11340}{140}} = \sqrt{81} = 9$

(b). $x = \sqrt{\frac{14 \times 1260}{9 \times 10}} = \sqrt{\frac{17640}{90}} = \sqrt{196} = 14$

W. G.

Editorial note: The solutions submitted by A. M. and W. G. are obviously correct, the introduction of an additional factor by J. R. being an unnecessary complication.

◆

THE vertical belt drive has always been a sort of hoodoo, and perhaps always will be. About the only way such a drive can be run satisfactorily without keeping the belt "drum-string-tight" is by the aid of an idler, and—how some men preach against idlers. Personally, I am not opposed to idlers where they are necessary. They don't consume much power if properly designed, aligned, oiled and kept clean. It has been proved in actual tests that idlers of this type consume so little power that the loss isn't even traceable.—N. C. N.

The Development of Irregular Sheet Metal Pipe Connections

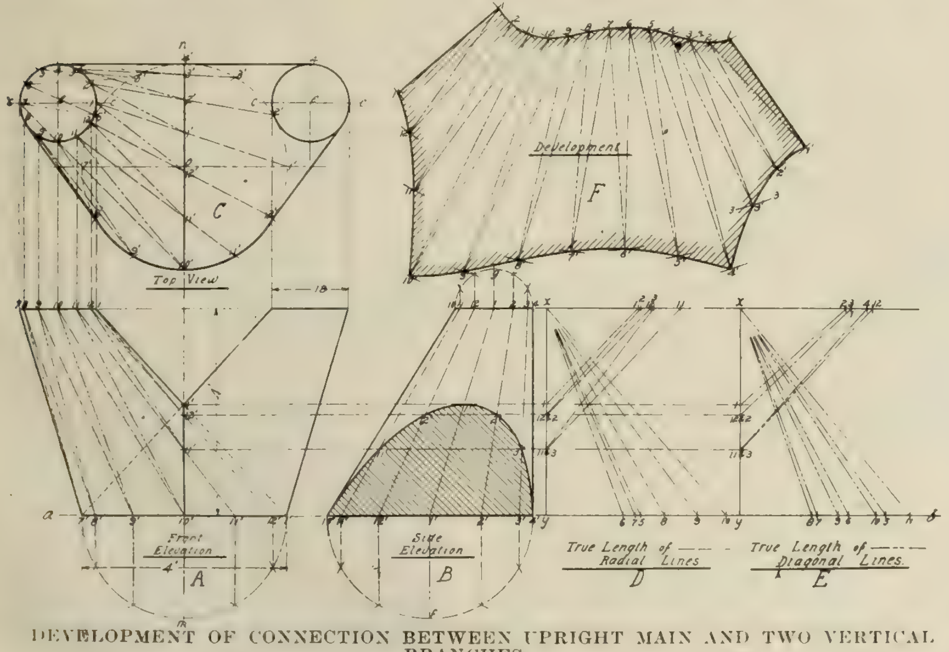
Staff Article

The problems dealt with in this article are typical examples encountered in actual practice, which, while not of very frequent occurrence, may be of considerable importance when met with. They possess considerable divergence from ordinary symmetrical forms and a study of the methods employed will enable them to be successfully applied in practice.

CONNECTING UPRIGHT MAIN TO TWO VERTICAL BRANCHES

By R. Hamilton.

A PIPE connection is required to unite two branches to the main supply pipe; all three pipes of circular cross section and in a vertical position. The main pipe is 4 feet in diameter, the two branches 1 foot 6 inches in diameter, with one side of the connection perpendicular with the base or large opening, and the projection of the pipes—as shown in the top view—tangent to one another, the altitude of the connection being 4 feet.



DEVELOPMENT OF CONNECTION BETWEEN UPRIGHT MAIN AND TWO VERTICAL BRANCHES.

This problem with the accompanying solution illustrates an interesting example in triangular development. To obtain the three principal views necessary for the desired solution, proceed as follows:—First erect the perpendicular centre line mn, and from the point 0 describe a circle having a diameter of 4 feet; tangent to this circle at the point 4 draw the horizontal line 44^14. At a distance below this line, equal to the radius of the small branch pipe, draw the two horizontal lines ce and ce. With O as a centre and a radius equal to the radii of the large and small pipe, describe arcs cutting the lines ce at the point (e); with (e) as a centre, describe a circle representing the opening of the two branches, one on either side of the large circle. The top view can be completed by drawing the tangent lines connecting the three circles, and also the centre line representing the joint between the two halves of the connection, each of which are similar, but formed in the opposite directions. To obtain the front elevation, draw the base line ab and project the various points from the top view, cutting this base line and also the top line, which is drawn parallel to ab and at a height equal to the altitude of the piece; that is 4 feet. To the right of the front elevation, with a radius of 2 feet, and the point I as a centre, draw the semicircle 4^1f10^1 and divide it into six equal parts; from these points erect perpendicular lines cutting the base line as shown. From the point 4^1 draw the vertical 4^14, cutting the top line at the point 4; with 4 as a centre and with a radius equal to the radius of the small pipe, describe an arc cutting the top line at the point I; with the same radius and the point I as a centre describe the semicircle 4g10. Divide this semicircle into six equal parts, projecting the points down cutting the top line as shown. Now, from corresponding divisions in the large and small circles, in the top view, and also those in the front and side elevations, draw lines as shown. For instance, in the top view connect the points 1, 2, 3, etc., in the smaller circle with the points 1^1, 2^1, 3^1, etc., in the large circle; likewise in both elevations.

In the side elevation it is necessary to obtain the true shape of the opening between the two connections. From the points 1^1, 12^1, 11^1 on the centre line mn in the front elevation draw the horizontal projecting lines cutting corresponding radial lines in the side elevation as shown. Through these points draw the curved line 10^1, 11^1, 12^1, 1^1, 2^1, 3^1, 4^1.

True Length of Construction Lines

Before proceeding with the development of the pattern, it is necessary to obtain the true length of both the radial lines and the diagonal lines. The radial lines are those connecting similar points of division on the upper and lower surfaces, and the diagonal lines are those connecting opposite ends of adjacent radial lines; for instance, the line joining the point 9^1 on the base line with the point 10 on the top line is termed a diagonal line, etc. To obtain the true length of a line that is at an oblique angle to both the horizontal and vertical planes, proceed as follows:—By using the projection to a vertical line, of a line in the elevation, as one leg of a right triangle, and the length of the line as represented in the plan or top view, as the other leg, the hypotenuse of such a triangle will be the true length of the line. Therefore, to obtain the true lengths of the radial lines for the development of the pattern, erect the vertical line xy as shown at D, the point (y) being on the base line and the point (x) on the projection of the top surface. With the exception of the lines that intersect the centre line mn, it is evident that the vertical leg of the right triangle will equal the length of the line 4. 4^1, as shown by the horizontal projection. The various lengths of the horizontal legs are obtained from the top view; thus, the distance y6 in D equals the length of the line, 6. 6^1 in the top view; the line y7 in D equals the line 7. 7^1 in C; the line y5 in D equals the line 5. 5^1 in C, etc. For those lines falling on the centre line mn, the vertical leg of the right triangle is obtained by projecting the points 1^1, 2^1, 3^1, 11^1, 12^1 in B to the vertical line xy, the horizontal leg being derived as previously stated, with the exception that the length is taken from the top circle to the centre line mn.

The true length of the diagonal lines is obtained in the same manner, the vertical leg of the triangle being the same, and the horizontal leg being the length of the line in the top view, passing from a certain division on the base circle to the adjacent division on the top surface.

For instance, the distance x9 in E equals the length of the line 9^1, 10 in C, etc. The true lengths of the diagonal lines that intersect the radial lines cutting the centre line mn are found similar to that already described.

Pattern Development

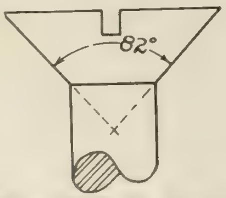
To lay out the development on a flat surface, a start can be made from any point, but as a matter of convenience we will start with the line 4^1, 4, this being the only line whose true length is shown in the elevation. To distinguish the radial lines from the diagonal lines, the former are shown as a series of long dashes, while the diagonal lines are represented by long dashes, with two short dashes intervening. First draw the line 4^1, 4 in F equal to the corresponding line in the front elevation, then with 4 as a centre and the length 3, 4 in E as radius, describe the arc 3, 3 in F. With 4^1 as a centre and the distance 3^1, 4^1 on the irregular curve in B as a radius cut the arc 3, 3 in F at the point 3^1. Then with 3^1 as centre and 3, 3 in D as radius describe the arc x, x, and with 4 as a centre and one of the divisions on the small circle in the top view as a radius, cut the arc x, x in F at the point 3. The completion of the development can be easily understood from the above explanation, care being exercised in following the method described. Remember that when using the points 1, 2, 3, 4, etc., as centres, the radii will be the diagonal lines as found in E, and the distances represented by the divisions on the smaller or top circle. When using the points 1^1, 2^1, 3^1, 4^1, etc., as centres, the radii will be the radial lines as found in D, or the distances represented by the divisions on the larger base circle, or that shown on the irregular curve in B.

The foregoing constitutes the reply to a reader's query.

* * *

Questions and Answers

Question.—When referring to machine screws, etc., what is meant by an included angle of 82 degrees?



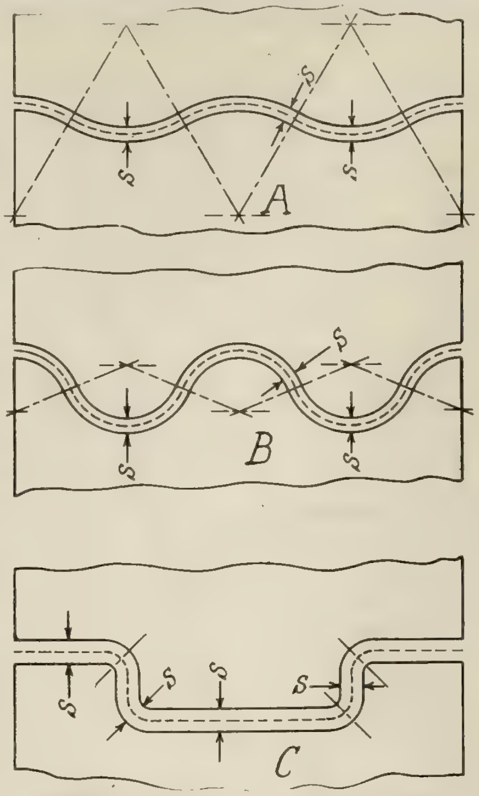
INCLUDED ANGLE ON HEAD OF SET SCREW.

Answer.—The included angle is the number of degrees contained within the angle formed by the opposite edges of the bevel portion of the head, as shown in the sketch. This angle is recognized as the standard for machine screws.

* * *

Question.—When fitting corrugating rolls, should the two rolls fit each other?

Answer.—Flat rolls should fit the entire length, unless they are small in diameter in proportion to their length, when it is sometimes advisable to leave them a little high in the centre to allow for the spring. When fitting forming rolls with an odd-shaped contour, the thickness of stock must be allowed for, to insure perfect operation. Neglecting the question of spring in the metal being worked (which is often an essential factor in the harder metals), the space (S) in the sketch, when measured at right angle to the surface, should equal the thickness of the stock. This can be more clearly shown in the sketches (B) and (C), where certain portions of the stock in the latter are at right angle to the axis of the shafts.



SHOWING AMOUNT OF SPACE LEFT BETWEEN CORRUGATING ROLLS.

* * *

Question.—The foundation for a large machine is to be built of concrete to a depth of 7 feet; the base of the machine measures 18 x 11 feet. If the concrete extends for 6 inches on all sides and the bottom dimensions are 21 x 14 feet, what will be the volume in cubic yards, and the weight of the concrete, the specific gravity being 4.8?

Answer.—The volume can be calculated from the formula,

$$\text{Volume} = D \times \frac{A \times 4\,m}{6} \text{ when}$$

D equals the depth of the prism.

A equals the sum of the areas of the top and bottom.

m equals the area of a section taken parallel with and midway between the top and bottom surfaces.

Top area equals 19 × 12, or 228 square feet.

Bottom area equals 21 × 14, or 294 square feet.

Middle sectional area equals 20×13, or 260 square feet. Then from the formula, volume $= 7 \times \frac{522 \times 4 \times 260}{6} =$ 1,822 cubic feet, or 67.48 cubic yards.

With a specific gravity of 4.8, the total weight will be 62.5×4.8×1,822 equals 546,600 lbs., or 273 tons.

* * *

Question.—When a train is going around a curve, do the outer or inner wheels slip to make up for the difference in length of the outer and inner rails?

Answer.—Just what action takes place when a train is passing around a curve is very difficult to determine, as several elements or forces are combined to effect the change in the train's direction. Some authorities claim that a certain percentage of slip takes place in obtaining the objective, while others contend that the higher elevation of the outer rail causes the force of gravity to draw the load to the lower level, thus effecting the desired change. While the above conditions are undoubtedly true to a large extent, one of the factors that has a great bearing on the question appears to be the tendency of the outer wheel to climb the outside rail. As shown in the sketch, the pair of wheels that are rigidly secured to the one axle, must make the same number of revolutions in travelling a certain distance; but the shape of the wheel profile is such that in rounding a curve the flange of the outer wheel is forced against the rail, the fillet causing the wheel to raise, so that the parallel motion that takes place on a straight track is changed to that of the frustum of a cone rolling on a flat surface, an exaggerated condition of which is shown in the lower sketch. Therefore, it is through the united efforts of the combined forces that the change is brought about.

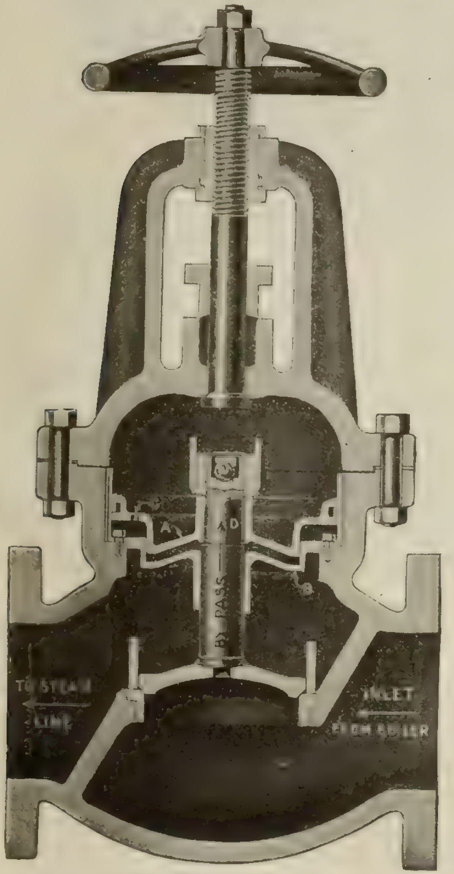
AUTOMATIC TRIPLE ACTING NON-RETURN VALVE FOR BOILERS.

NON-RETURN valves prevent the backward flow of steam into the boilers from the header in case of a rupture. The added emergency feature shown in the cuts also prevents an outward rush of steam should a break occur in the main steam line or branches. In a battery equipped with these valves the outflow from every boiler is stopped if anything happens to the header or main piping.



LONGITUDINAL SECTION AUTOMATIC TRIPLE-ACTING NON-RETURN VALVE.

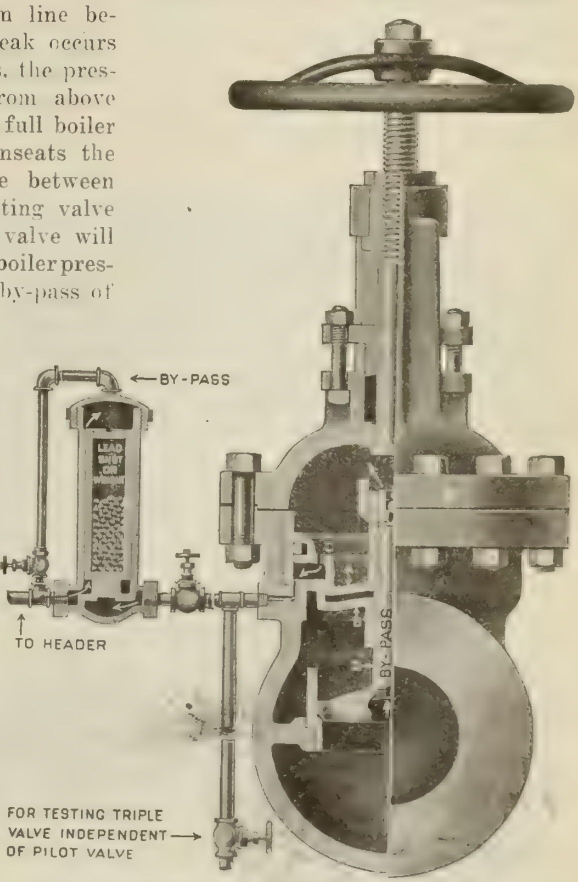
The sectional view shows the inside dash pot A attached to the valve disc, while the outside dashpot B acts as a cylinder, which is held firmly in place by cap bolts. The valve disc has a central port with a ball valve at the top and through this port full boiler pressure reaches the entire space above the liner and underneath the inside dashpot at C, therefore, it is balanced. A pipe connection is made to the exhaust port in the side of the triple acting valve, which communicates with the space between the two dashpots, being piped to the pilot valve which also connects with the outlet side of the valve or header.

The header pressure being on top of the piston of the pilot valve and the boiler pressure underneath, the weighted pilot valve piston, according to weight adjustment supplies the variation on which the triple acting valve will operate in case of a burst steam line beyond the valves. When a break occurs in the steam main or branches, the pressure is instantly removed from above the pilot valve piston and the full boiler pressure being underneath, unseats the piston, allowing the pressure between the dashpots of the triple acting valve to escape. The triple acting valve will immediately close, and the full boiler pressure still coming through the by-pass of the valve disc on top of dashpot A holds the valve to its seat, cutting off the flow of steam from the boilers.

Thorough cushioning of such valves is vitally necessary to eliminate disastrous hammering or pounding, and the Double Corliss Dash Pot arrangement, occupying the full area of the upper portion of the body, insures smooth, economic and reliable operation; holds the valve disc in perfect alignment with the seat, and makes the valve practically indestructible due to service. In the closure of the valves the double cushioned feature allows a quick drop to within 1/8 in. of the seat, then the valve closes easily under the control of the secondary dashpot. By turning the handwheel, the stem may be run down on top of the valve disc, thus making a permanent closure of the valve.

The triple acting valve may be closed or tested at any time independent of the pilot valve by having a small branch line run to any convenient point with a small hand valve attached, as illustrated. Upon opening the small valve and allowing the exhaust of pressure from between the dashpots of the triple acting valve, the latter will close—thus providing for all contingencies and insuring absolute safety in the operation of the plant. An automatic valve should be tested automatically to prove it operative to close in event of accident.

There is no adjustment to be made in the triple acting valve. The automatic pillot valve can be quickly set for any variation of pressure by simply adding or removing shot or other weight from the hollow piston for greater or less variation between the boiler and header pressure. The boiler and header pressure can drop together from say 175 to 50 pounds without operating the valves, but, the instant the variation of pressure reaches that for which the automatic pilot valve is set, the valves will operate quickly—which is the only time you want them to operate. The Golden-Anderson Valve Specialty Co., Pittsburgh, Pa., are the manufacturers of the foregoing.



PART CROSS SECTION THROUGH AUTOMATIC TRIPLE ACTING NON-RETURN VALVE.

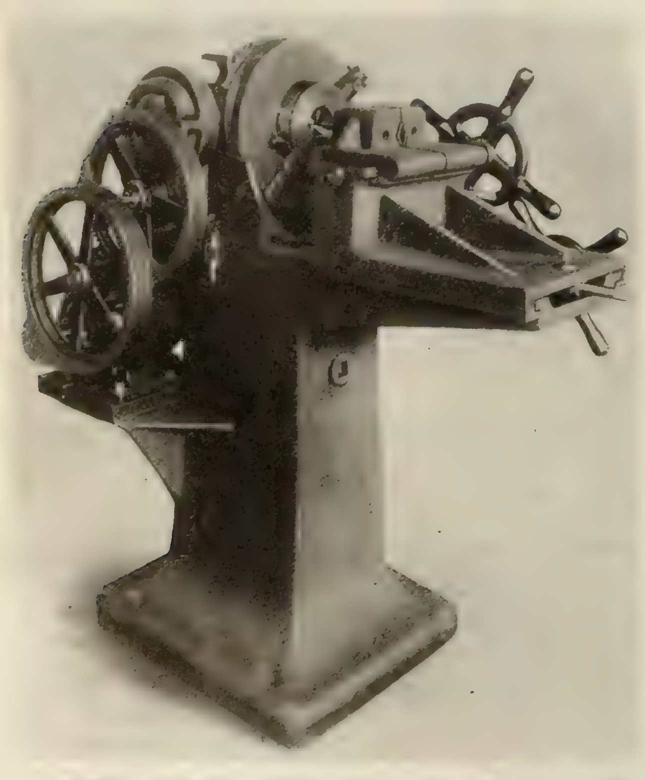
COMBINATION THREADING AND CUTTING-OFF MACHINE

THE machine shown is one of a line of pipe and nipple machines developed by the Oster Manufacturing Co., of Cleveland, Ohio, to meet the demand for a pipe machine that would perform every one of the many pipe threading jobs ordinarily required, using pieces long or short, straight or bent, over or under size, nipples of any length, and all-thread nipples.

The illustration shows the 300-B machine for ¼ to 2-inch pipe. It is operated by a ¾ h.p., direct or alternating current, Westinghouse motor, the motor being mounted on the machine base, direct connected, with ample power and speed for all classes of work.

The machine illustrated is a combination threading and cutting-off machine, a combination pipe, nipple and bolt machine. It will thread bolts from 7-16 to 1¼ inches. The regular standard equipment consists of motor, geared oil pump, automatic cut-off apparatus, automatic die release, and four sets of right hand pipe dies from ¼ to 2 inches. The special features are the lever operated die head and the open type pipe vise, which makes the machine a rapid producer. The dies are automatically oiled and the operator can see the work of threading at all times.

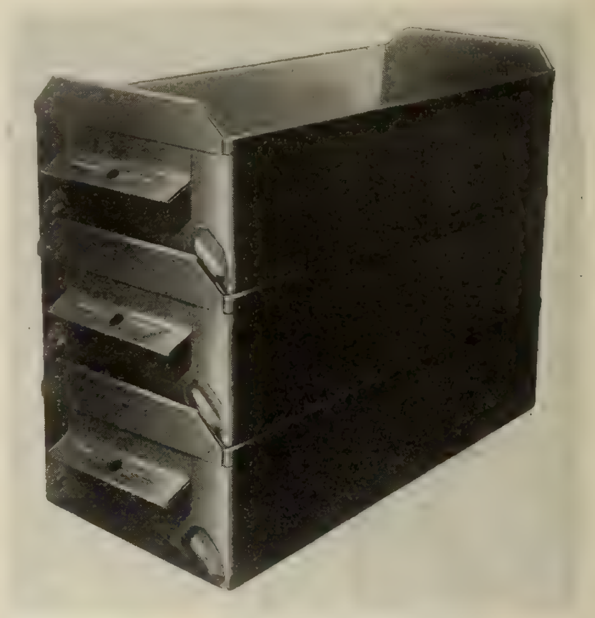


MOTOR DRIVEN THREADING AND CUTTING OFF MACHINE FOR ONE-QUARTER INCH TO TWO-INCH PIPE.

One advantage of the machine is the open type vise which enables the operator to change the work quickly and thereby increase the capacity. Every operating part is right under the hand so that not a moment is wasted. The vise grips the work by a single turn of the wheel, bringing it to an absolute centre, and can be moved up close to the die head for threading short pieces, short bends, nipples, bolts, and casings.

The quick die release feature of the machine makes possible the opening of the dies at the instant the thread is finished. It opens the dies gradually and removes the burr, leaving a clean, perfect thread. At the same time, the vise carrying the pipe is thrown back, withdrawing the pipe from die head. This contributes to faster and more perfect work, and insures duplication of the length of the thread. When adjusted for the length to be cut, it will repeat automatically without any attention on the part of the operator. One set of dies will thread two or more sizes. They are made of a high-grade carbon steel carefully tempered, and are controlled by a lever, being opened or closed by one movement of the hand while the machine is in motion. The lever is fastened to the die arm and is used in releasing the dies when the thread is cut, in setting them to same size for making duplicate threads, in changing the dies from one size to another, and in setting them to graduation on the face plates. When the thread is finished it is only necessary to trip the die lever, and this opens the dies right off the work, without making it necessary to stop the machine.

For threading close nipples the machine may be equipped with two-threaded nipple holders which are attached to the front of the regular jaws by two bolts. The threaded end of the nipple is held in these holders while cutting a thread on the other end. When the thread is cut, the vise jaws are opened by the half turn of the hand wheel and the nipple drops out. The cutting-off apparatus operates automatically by means of a pawl attached to the frame of the machine, a ratchet attachment automatically regulating the feed of the cutter. The oil pump is so arranged that no belt or chains are necessary to drive it. It is connected direct to the gears of the machine and operates constantly while the machine is in motion, thus insuring a steady and constant flow of oil to the dies. It is a combination pump and works both ways, for right and left hand threading. The oil is contained in a reservoir within the base of the machine. The pump lifts the oil from the reservoir and floods the dies and cutters, when the oil is returned to the reservoir through a strainer.



IMPROVED STACKING TOTE BOX.

* * *

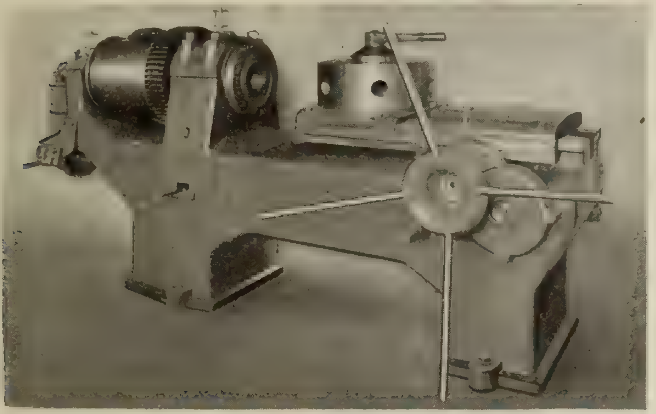
IMPROVED STACKING TOTE BOX.

AN improved stacking tote box is being marketed by the New Britain Machine Co., New Britain, Conn., and in its construction are embodied several features which are designed to eliminate the faults heretofore found in boxes of this type in general.

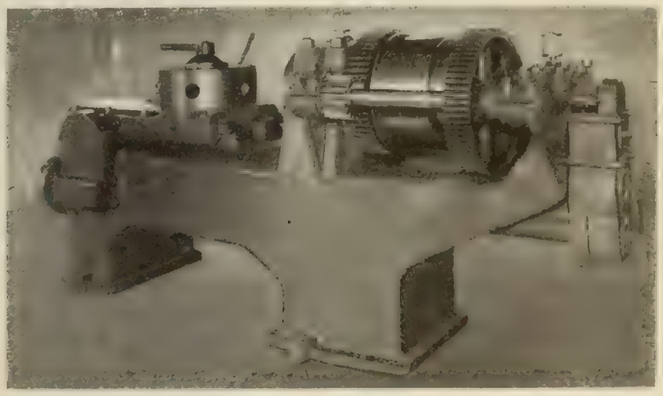
The box is made from No. 16 gauge steel and electrically welded throughout, no rivets whatever being used. Handles are of No. 14 gauge stock, folded double and punched to afford hook hold for dragging box along the floor. The size adopted, 20 in. by 12 in. by 6 in. is considered best for average requirements, being in length and capacity about the limit for comfortable one-man handling.

The sides slope inward just enough to provide support for the box above and are folded on to the ends. The deviation of the sides from square, however, is so small that rectangular work can be packed in as conveniently as irregular pieces. A ¾ in. selvage around the edge of the box greatly increases its stiffness. The ends extend one inch above the sides and are folded over on to the selvaged edge of sides where the latter lap on to the ends. These raised ends are bent outward sufficient to permit box above to slip between.

Spot welded to the bottom and slightly shorter than the box are two half-round runners. These are carefully beveled on ends and so placed that, when box is in stacking position, they are in contact with edges of box below, thus opposing any tendency of sides to spring in under heavy weights. The upper corners of ends are cut off at a 45° angle, and embossed pieces are spot welded to lower corners of ends parallel with the upper corners and in such position as to act as guides in bringing box to stacking position. These guides in conjunction with the runners also serve to prevent any sidewise shifting of boxes while being trucked. As indicating the security of the stacking feature, a stack of ten boxes can be tilted to an angle of almost 45° before buckling.



FRONT VIEW OF SHELL BORING MACHINE WITH INTEGRAL FRAME CASTING.



REAR VIEW SHOWING HEADSTOCK GEARING WITH COVERS REMOVED.

In dragging boxes over the floor the runners present only line friction and remove wear and tear from bottom of box. As a result of this feature, the "New Britain" Stacking Box lends itself to storage in racks because it will slip into and out of rack with great ease. Owing to this small bearing surface and the firmness of the stacking feature, it has been found that a stack of five or six loaded boxes can be dragged along the floor with remarkably slight effort.

By reason of the raised ends generous space is provided above the handle for card holder, in which position it more readily indicates contents of box and is less liable to become soiled.

* * *

SHELL BORING MACHINE

THE rapid and accurate performance of the boring operation on large shells, calls for machine tools which are amply capable of doing heavy duty work, and the Hare Boring Machine, shown in the photograph herewith, and which takes any size shell up to 8 in., has been built by the Reliance Machine Co., Toronto, to meet the demand for machines of this type.

The frame of the machine is a single casting with bed, legs, headstock and bearings integral. The spindle is of semi-steel and is formed with a 15 in. dia. flange which carries a collet type chuck (not shown). The front bearing is 8½ in. dia. by 12 in. long, being large enough to allow a 6 in. shell to enter the spindle. The dia. of the spindle at the drive gear is 9½ in., the gear being 4½ in. wide, and 3 diametral pitch. The two step cone pulley has diameters of 15 in. and 18 in., and a ball thrust bearing is provided at the rear end of the spindle.

The turret is 20 in. dia., and has six 3 in. holes for bars, each hole having a keyway on the bottom side, while two set screws on top serve to hold the bars securely in position. A spigot is provided on the outside diameter of the turret to remove any possibility of tipping, and the center stem has a hole through which boring bars may be knocked out from behind. A hardened steel locking ring and pawl locate the turret in the various positions.

Carriage is 42 in. long with the power feed applied through a steel rack 3 in. wide located centrally on the underside of the carriage. A tripping pawl on the side of the carriage disengages the power feed at any desired point. Four feeds from 1-32 in. to ⅛ in. are controlled through levers on front of machine, ball bearings being provided for all thrusts throughout the feeding mechanism.

All gears are completely guarded in use, and equipment includes countershaft with pulleys, oil pump, pans, piping and wrenches. As equipped for 6 in. shells, the machine weighs 8,000 lbs.

The Dominion Royal Commission concluded its session in Toronto on Oct. 19. and is now sitting in Ottawa.

CANADA'S ANNUAL TRADE EXCEEDS 1½ BILLION DOLARS

AGGREGATE Canadian trade, exclusive of coin and bullion, for the twelve months ending with July, totalled $1,587,933,707, as against $919,178,659 for the corresponding period ending with July, 1915. This is an increase of $668,755,048.

Imports of merchandize totalled $622,886,350, an increase of more than $200,000,000 as compared with the total for the twelve months ending July, 1915. Exports of merchandize totalled $965,047,457, as against $499,872,322, an increase of $460,000,000. The balance of trade in favor of exports during the calendar year was more than $340,000,000.

The total duty collected during the twelve months was $121,906,788, as against $78,787,427 for the twelve months ending with July, 1915, an increaes of about forty millions. The average ad valorem rate of duty on dutiable goods for the twelve months was 34.44. On all goods imported the average rate of duty was 19.45 per cent.

FRENCH SYNDICATE SEEK PAPER PLANT

A SYNDICATE of Parisian newspaper publishers is seeking the purchase of the $1,000,000 paper-making plant of the Donnacona Paper Company, which has been in operation two years. It has a valuable waterpower, some 6,000 horsepower of which has been developed, and holds timber lands said to aggregate 228,000 acres. The total output on November 1 will be 100 tons of newsprint daily.

The syndicate endeavored recently to purchase the Remington Paper & Power Company's property in New York State, but was outbid by Sears-Roebuck interests. While the production of the Canadian plant is not so great as that of the Remington company, its location is considered more satisfactory to the French buyers.

THE DECIMAL SYSTEM IN CURRENCY, WEIGHTS AND MEASURES

THE present-day tendency, aside from the war effects, is towards standardization, it being clearly evident that the latter makes for efficiency; notwithstanding, to the war and the trade relationships which will prevail as its result will the most pronounced progress towards standarization be traceable. In a word, there are practically certain to be created universally accepted decimal systems of currency, weights and measures in business transactions. Even in Great Britain, where exists the triple antithesis to the decimal system, and where the propriety of adopting the new methods of reckoning has been many times discussed and as often flouted, public opinion is being stirred to action and ripened to the point of ultimate adoption. What is Britain's concern in this matter is also that of Canada, for while we boast a decimal currency we are like her involved in the weights and measures feature. Again, the good and substantial reasons why Britain's manufacturing and commercial interests judge a change to be essential are applicable in every respect to us.

It is contended that we have reached the parting of the ways, in a word the time has come when the decimal system in its entirety must be adopted if we would both secure a footing and maintain it when the anticipated trade war follows the bloody struggle in Europe. We have been parties to the Allies' Conference and have, so to speak, committed ourselves to certain lines of action when peace is declared, one anticipated result being, of course, the derivation of trade benefits and closer commercial ties with our partners in the meantime struggle. As an indication of the importance attaching to this feature, it may be noted that France, Belgium, Serbia, Portugal, Roumania and Italy have each adopted the metric system, and together with Russia and Japan, they have the decimal system of currency.

Opposition and quite strenuous opposition to the change is to be expected, and is indeed far from inactive. The opposition, however, relies less on adduced reasons than on innate, stubborn conservatism and distaste of change, however necessary or desirable be the latter. A wound to national pride would be involved in the nationalization of a decimal system, it is said, on a par with which was the one-time neglect by Britishers of the acquirement of foreign languages, the reason being that if business was wanted to be done, the foreigner should transact it in the English language. The latter attitude, even preceding the war, had happily largely disappeared, yet we are not altogether sure but that a few dregs still remain, as an illustration of which antagonism to the recent and successfully operated Daylight Saving Act in Great Britain amply demonstrates. Not a few people refused to alter their watches, although the official time had been changed and as a consequence of their fight for independence of action, they subjected themselves to no end of inconvenience. The Daylight Saving Act as far as Great Britain was concerned brought untold benefit in a myriad directions, yet it meant a cross to many or was assumed as such because a disturber of their work-a-day existence.

Opposition to national progress and development of the nature indicated is usually as numerically weak as it is trivial, and may be reckoned so relative to the national establishment of decimal systems of currency, weights and measures. It is realized that Germany's success in foreign markets was due in large measure to her appropriation of the decimal system, and it is further realized that with the advent of peace and the resumption of national, commercial intercourse, she will still have that advantage unless Britain and her Colonies do business by like direct standards. Canadian industry and commerce may be said to be equally involved with Britain in this matter of the wholesale adoption of the decimal system of reckoning. We are anticipating and preparing for a footing in the markets of the world, and while our currency is no encumbrance the same cannot be said of our weights and measures which are British. In addition to the Allied Nations already referred to in detail as having in operation the decimal system, neutral nations, including the South American and Latin-American Republics, Holland, Norway, Switzerland, Sweden and Spain are also so provided.

Little heed, if any, has been given to the decimal system need in our projected capture of a share of world markets, judging at least from public pronouncements on the subject. We are of opinion, however, that our business interests will not only find it advantageous to follow Britain's lead in the matter, but will unhesitatingly and unanimously lend active support in establishing in its entirety a decimal system of Empire trading. The Liverpool *Journal of Commerce*, speaking of our weights and measures, says: "Who offhand has any appreciation of the relation of the ounce to the ton or of the foot to the mile? Which of us knows how many square feet make a square mile, or is familiar with the basis of calculation adopted by the bricklayer or the carpenter in roofing a house, for instance, or a land agent in estimating the area of an estate? How many cubic inches constitute a cubic yard, and how does the pint stand in respect to the gallon? We live, in fact, in an arithmetical setting with which few of us are at home, in spite of all the efforts of the elementary schoolmaster. Many opponents of change would, we suspect, reveal under cross-examination that they know little of the so-called systems which they defend. Our tables happen to be British and insular, and therefore we rather like them, but it cannot be said that they have much else to recommend them."

INDUSTRIAL NOTABILITIES

LLOYD HARRIS, of Harris, Cook & Co., financial agents, Brantford, Ont.; vice-president, Canada Starch Co., director, Willys-Overland Co. of Canada; director, Trusts and Guarantee Co.; president, Russell Motor Car Co.; director, Dominion Power & Transmission Co.; director, Steel Company of Canada, Ltd.; president, Canada Glue Co.; managing director, Underfeed Stoker Co. of America, Chicago; vice-president, Canada Cycle & Motor Co., was born at Beamsville, Ont., March 14, 1867, son of John and Jane (Tufford) Harris. He was educated at the Public Schools, Brantford, the Collegiate Institute, and at Woodstock College.

LLOYD HARRIS

He began his business career in the service of A. Harris, Son & Co.; went to Europe in the interests of his firm in 1889; became resident manager in Great Britain, with head office in London, and upon the formation of the Massey-Harris Co. he returned to Canada in 1900, since which time he has devoted his whole time and attention to private interests.

Mr. Harris is a member of the Military Hospitals Commissions; represented Brantford in House of Commons, 1908-1911; member of Brantford City Council, 1905-1906; president, Brantford Board of Trade, 1902-1903; vice-president, Canadian Manufacturers' Association, 1905; director, Ontario Motor League; president, Brantford Lacrosse Club. He was presented to the late King Edward VII., Windsor Castle, in June, 1905; received appointment as Hon. Lieut.-Col. 25th Brant Dragoons, 1909; resigned 1912.

Mr. Harris married Mary Perkins, daughter of James Perkins, Petrolea, Ont., 1887 (deceased 1892); secondly, Evelyn Francis Blackmore, daughter of Capt. William Blackmore, Penzance, England, March 10, 1897; has one daughter. His clubs are Brantford, York, National, Toronto, R.C.Y.C. (all of Toronto); Rideau and Country (Ottawa); Sports (London, Eng.); Hamilton, Tamhaac (Hamilton), and Caledon Mountain Trout Club. His societies are A.F. & A.M., and his recreations motoring, tennis and bowling. In politics he is a Liberal, and in religion Anglican. His residence is 110 Brant Avenue, Brantford, Ontario.

The General Market Conditions and Tendencies

This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents.

Montreal, Oct. 23, 1916.—Industrial conditions in every part of the Dominion indicate that relaxation of manufacturing and commercial activity is neither present nor near future imminent. The continual advance in price quotations of all classes of commodities gives no indication of an early cessation of current demands. The contemplated strike of C. P. R. trainmen does not tend to improve the present strained business situation, a railroad tie-up at this time being highly undesirable from every aspect. The labor problem is apparently not so acute meantime, owing to the increased employment of women workers in many of our munition plants.

Pig Iron

Increased activity has featured the pig iron situation, and the condition of the market is reflected in the general advance on all grades of American produce. This advance ranges from $1 to $2 per ton; certain grades of low phosphorus pig show an increase of $4 per ton. The demand for steel-making pig is greater than the furnaces can supply.

Steel

The ever-ascending prices of raw and semi-finished materials appear to be the serial feature of the present abnormal steel situation. The demands upon the mills are so incessant, and the orders piling up so rapidly, that deliveries are being extended into the first quarter of 1918. With the mills so crowded with munitions orders, domestic requirements have to be curtailed. Steel for munitions purposes is none too plentiful, and many shell makers are experiencing difficulty in filling their contracts, although reports seem to indicate a little relief in this direction. The demand for billets and sheet bars is extremely heavy, and all mills are pressed to the utmost in their effort to meet the consumers' needs. An advance of $5 per ton is quoted on the East Pittsburg price of forging billets, the quotation at maker's mill being now $75 per ton. No abatement marks the demand for plates, car builders and shipyards being the most persistent inquirers. That a general advance in the price of sheets may be anticipated is indicated by the recent advance of from $3 to $5 on the products of the American Sheet & Tin Plate Co. The revised prices are for first half of 1917 delivery. An advance of $5 per ton is reported on the New York price of steel bars.

The expected advance on wire products has partly materialized, $2 being added to the Pittsburg price of nails and barbed wire; the former being now quoted at $2.70; painted barb at $2.85, and galvanized at $3.55 per hundred pounds. The discount on wire fence (carload) is now 59 per cent., instead of 60. While nothing has been done in local circles regarding the advance in prices, dealers are considering a revision of their present quotations. The only changes reported are on galvanized sheets, Queen's Head having declined 25c per hundred, the current quotation being $7.50. Fleur-de-Lis, quoted at $7.25, shows a decline of 10c per hundred.

Metals

No developments have taken place to change the general quiet tone of the market, which has again resumed its steady position, following the temporary scare of the past two weeks. Copper is firm and strong. Tin is gradually resuming the position held before the recent excitement. Spelter is inactive, but comparatively firm. Lead is very firm, with a stronger undertone. Antimony is fairly active, with quotations strong. Aluminum is quieter.

Copper.—While the general situation continues to retain its extremely strong position, the market is comparatively quiet, and unless something unforeseen should happen to change existing conditions, it is likely to remain so for some time to come. The fact that the majority of consumers are well covered for present and near future requirements tends to inactivity on the open market, although small sales are being quietly made, and while the purchase price is reported to be slightly below the prices quoted, these sales are not likely to affect the general market conditions. Dealers are careful in closing contracts for metal, owing to the uncertainty of obtaining supplies. Producers are so filled with orders that they are not taking any active part in the present market, being content to leave the situation in the hands of the dealers until such times as further developments should take place. The British market remains very firm, with London quoting a 20-shilling advance on spot and a thirty-shilling on futures, the current price of Spot copper being £124 per ton. The New York market is strong and very firm, with quotations on lake and electrolytic unchanged at 28½c and 28¾c per pound respectively; casting is ⅛c higher at 27⅜c per pound. The local situation is unchanged, with prices firm at 31c for lake and electrolytic, and 30c for casting.

Tin.—The scare due to the near activity of submarines, which created such excitement a couple of weeks ago, has practically disappeared, and conditions are again about normal. Pronounced activity is not, however, apparent, although sufficient business is passing to maintain tin in its present strong position. The London market has become a little easier, as indicated in a decline of approximately 20 shillings on this week's quotations. New York has recovered from its last nervous spell, this being reflected in a further decline of ½c in this week's quotation, the nominal price being now 41c per pound. Local dealers report a fairly active market, with quotations at 45c, an advance of ½c per pound.

Spelter.—While sufficient buying is taking place to prevent the market taking on a stagnant appearance the activity is not such as to break the general dullness. However, there appears the possibility that improvement may soon be realized. Now that consumers are showing increased interest in the market, with sellers of metal not anxious to dispose of it at present low prices, a return to higher quotations is not unlikely. With refined spelter on the decline and the cost of ore maintained, producers are not inclined to sell metal at existing prices, believing that the market will shortly return to a position where a profit is possible. London reports a forty shelling decline on spot, and futures are slightly easier. New York has fluctuated during the week, the present quotation being ⅛ cent lower than last week; the nominal price being now slightly below 10c per pound. No change is noted in local conditions and dealers are reporting spelter as firm at 13c per pound.

Lead.—The situation is apparently so sound that any excess demand at the present time would result in higher prices. The supply of metal does not overlap the consumption to any great extent, and producers are well sold for several months ahead. Additional buying developments would therefore create a stronger market, subsequently boosting the price of the metal. However, should business be placed for first quarter delivery, it is possible that a considerable volume would be accepted at current prices. The London situation is very steady, while New York retains its strong position, quotations being 7c "Trust" with independents quoting ⅛c higher. The situation here is unchanged with prices strong and firm at 9c per pound.

Antimony.—The strong tone of the New York market has been maintained by the continued demand for metal from Canadian consumers. The placing of additional munitions orders is responsible for the increased purchasing, and the condition of the market is reflected in present quotations, which at 13¼c is an advance of ½c over last week. Dealers here report an active market, with prices firm at 15c per pound.

Aluminum.—The recent activity has subsided and the market has returned to position of a few weeks back. The situation is still very strong, but prices are again becoming easier, New York reporting a decline of one cent on No. 1 Virgin and 2c on pure remelt, quotations being 66c and 61c respectively. Dealers here report a slightly easier market, but prices are firm and unchanged at 70c per pound.

Machine Tools and Supplies

While the greater volume of present business is in munition making machinery these is in evidence a very encouraging demand for domestic equipment, much of which is due to the activity that Canadian manufacturers are displaying in the possibilities that recent foreign made exhibits have opened up for them. Already many lines of product, hitherto confined to other parts of the world, are being carefully considered with a view to manufacturing and inquiries for suitable machinery indicate that action is likely to result. Owing to the introduction of female help into various lines of industry, the labor question is less acute and additional equipment, necessary for maximum production, is now being installed.

Enlarged Canadian Trade Intelligence Service

Under the arrangement made by the Minister of Trade and Commerce with Sir Edward Grey in July, 1912, the Department of Trade and Commerce, Ottawa, is able to present the following list of the more important British Consulates whose officers have been instructed by the Foreign Office to answer inquiries from and give information to Canadians who wish to consult them in reference to trade matters.

BRAZIL
Bahia, British Consul.
Rio de Janeiro, British Consul General.

CHILE
Valparaiso, British Consul General.

COLOMBIA
Bagota, British Consul General.

ECUADOR
Quito, British Consul General.
Guayquil, British Consul.

EGYPT
Alexandria, British Consul General.

FRANCE
Havre, British Consul Generai.
Marseilles, British Consul General.

INDIA
Calcutta, Director General of Commercial Intelligence.

ITALY
Genoa, British Consul General.
Milan, British Consul.

MEXICO
Mexico, British Consul General.

NETHERLANDS
Amsterdam, British Consul.

PANAMA
Colon, British Consul.
Panama, British Vice-Consul.

PERU
Lima, British Vice-Consul.

PORTUGAL
Lisbon, British Consul.

RUSSIA
Moscow, British Consul General.
Petrograd, British Consul.
Vladivostock, British Consul.
Odessa, British Consul General.

SPAIN
Barcelona, British Consul General.
Madrid, British Consul.

SWEDEN
Stockholm, British Consul.

SWITZERLAND
Geneva, British Consul.

URUGUAY
Monte Video, British Vice-Consul.

VENEZUELA
Caracas, British Vice-Consul.

Delivery of the heavier type of munition lathes is still backward. With few exceptions, shipment of standard tools has become almost normal. That further advances can be expected in the price of supplies is generally conceded, due to the continual advance in the cost of raw materials. Price lists are constantly being revised to meet the higher costs of production, and under the uncertain conditions that now prevail, it is not unlikely that still higher prices will rule in the future.

Scrap

The market in old materials is still retaining its strong position in conjunction with the condition of the steel and metal markets. The recent heavy sales of copper for export purposes has caused this scrap to be in good demand and prices have advanced accordingly. While some dealers have followed the market, others have been inclined to retain their old prices. The majority however are now convinced that existing conditions will prevail for some time, and this week's quotations show an advance of from 10 to 15 per cent. over that of the past few weeks; quotations range upon 19 cents for light to 23 cents for heavy and crucible scrap. Machine compositions are now 18½ cents, with turnings quoted at 15 cents. Brass clippings are now 15 cents and turnings 13 cents; being an advance of 1¼ and ¾ cents respectively. Wrought iron pipe scrap has advanced ¼ cent, and is now quoted at 10½ cents. Heavy and tea lead are ½ cent higher, being quoted at 6½ and 5½ cents respectively.

Toronto, Ont., Oct. 24.—An event of interest to Canadian manufacturers is the exhibition of enemy samples which is being held in Convocation Hall Building in this city. While a number of these samples are of very inferior grade and hardly worth consideration, there are others which might be copied with advantage and manufactured in Canada for sale in foreign markets as well as in this country. The exhibition is being held under the auspices of the Department of Trade and Commerce, Ottawa.

The freight congestion at the local terminals has again assumed serious proportions. Owing to the accumulation of freight in the yards awaiting delivery in the city, the railway companies have been compelled to refuse to accept from outside points consignments bound for Toronto of less than car lots. This embargo is naturally causing considerable delay and loss to local merchants. Shortage of labor, the railway officials say, is responsible for the congestion which has been more or less in evidence all this year.

Steel

The belief that there will be no improvement in the steel situation for at least eighteen months, if not longer, seems to be generally accepted. The mills are in a sold-up condition, and the demand shows no indication of falling off. The steel required for munitions alone will aggregate an enormous tonnage, while the amount of steel used for other purposes will be even greater. The revival in shipbuilding caused by the serious shortage of tonnage has already been partly responsible for what is practically a famine in steel plates, while steel rails are badly wanted, but cannot be obtained in sufficient quantities to satisfy the demand. With such conditions prevailing, prices will continue to advance, and the mills get further behind on deliveries. There are no changes to note this week in bars, sheets, tubes or plates, but wire nails have advanced 15c, and are now quoted at $3.95 per keg, with every possibility of the $4 mark being reached in the near future. Wire products have also advanced 15c per 100 pounds. Mills report the demand for locomotive and merchant tubes very heavy, some makers being sold up for practically eight months. The plate situation is getting tighter, prices being very firm and deliveries running into the second and third quarter of 1917.

CANADIAN GOVERNMENT PURCHASING COMMISSION

The following gentlemen constitute the Commission appointed to make all purchases under the Dominion $100,000,000 war appropriation:—George F. Galt, Winnipeg; Hormidas Laporte, Montreal; A. E. Kemp, Toronto. Thomas Hilliard is secretary, and the Commission headquarters are at Ottawa.

A slight decline in prices of galvanized sheets has been announced this week, but it is hardly likely that the new price will remain in effect very long, as the tending is decidedly in an upward direction. Higher prices on black sheets, particularly the lighter gauges, are expected shortly, in which case galvanized sheets would be affected, as spelter has been holding firm for some weeks. The demand for sheets of all kinds in the primary market is heavy and prices are very firm.

Further indication of continued strength in the steel situation in the U. S. is shown in the fact that agents of the Allied Governments are sounding the American market for steel to be delivered during the third quarter and second half of 1917. No definite tonnage has been named, but it will no doubt be as heavy as their requirements during the first half of next year. A few months ago 500,000 of bars, billets and forgings were purchased for delivery up to July, 1917. A feature of the market has been a tremendous demand for rails. It is said that the entire capacity of the rail mills has been sold through all of 1917. Prices on all steel products are very firm, but there are no price changes to note this week.

Pig Iron

A further advance of $1 per ton has been made on domestic pig iron, due, it is stated, to the increase in cost of iron ore and coke. Considerable strength, however, has recently developed in the market as a result of a better demand and improvement in the situation generally. The pig iron market in the U. S. is very active and prices very firm, with an upward tendency.

Scrap

The situation in the market for scrap metals is improving, and prices are generally firm. There is a shortage of old rails and heavy melting steel, with the result that prices have advanced in both cases. Machine composition and composition turnings are higher, having advanced 1c per lb. Steel turnings are coming in freely, but the demand is not very heavy. The scarcity of copper for 1916 delivery has been a boon to scrap dealers, who are getting unusually high prices for old copper.

Machine Tools

The situation in the machine tool market is practically unchanged. The bulk of the demand is still for heavy duty lathes, generally for one or two machines, but inquiries for other special tools for munitions plants are also being received in fair volume.

Supplies

Prices of all machine shop supplies continue very firm, and some advances have to be noted, the most important being in milled products, which are about 10 per cent. higher. Files have also advanced again, the discount now for the most of the makes being 65 per cent., as against 65 and 5 per cent. formerly. Gasoline is firm, following an advance of 10c per barrel on crude oil in the States. Indications point to still higher prices on crude oil, in which case gasoline and benzine will probably be affected.

Metals

While the metal markets are comparatively quiet, there is a firm undertone, and the situation generally is favorable. The consumption of most metals, particularly copper, continues heavy, which is tending to keep prices up, notwithstanding the large increase in production. Conditions in the trade locally are favorable, the market being steady at unchanged prices, with satisfactory volume of business. Copper has developed further strength during the week, due to increased demand, principally from domestic consumers. Tin is quiet but firm, with no further development in the market to note. Spelter is firmer on account of increased demand from galvanizing interests. Lead, antimony and aluminum are firm, but unchanged.

Copper.—After a short period of quietness, there has been a revival of the demand for copper and the market is very strong. Owing to the possibility of higher prices for copper, consumers are coming into the market, and are covering for their requirements over the second quarter of 1917. Local quotations are nominal and unchanged at 31c per lb.

Tin.—The market is firm and higher in London, but quiet and unchanged in New York. A little more interest is being taken in tin, but business is still very quiet. Local quotations firm at 44c per pound.

Spelter.—There is a better demand for spelter, including a number of inquiries from galvanizing interests. The market is firmer, but unchanged, although it has a higher tendency. There is a heavy consumption of spelter being about equal to production. Spelter is firm locally at 14c per pound.

Lead.—The leading interest is still quoting 7c New York, while independents are pretty close to that figure. The market is dull, but firm, and business is quiet, consumers being well covered for the time being. Reports from New York state that Canadian consumers have purchased about 2,500 tons of lead in the past week for prompt and November delivery at a base price of 6.85c to 6.90c New York. Local quotation 9c per pound.

Antimony.—Canadian consumers have recently purchased considerable quantities of antimony in New York, which has strengthened the market there. Local quotations, however, are unchanged, at 18c per pound.

Aluminum.—Demand is less active, but the market holds steady, and prices are unchanged at 68c per lb.

UNIFORM CONTRACTS FOR SHEET AND TIN PLATE

ADVICES from Pittsburgh state that uniform contracts in the sheet and tinplate industry in which there shall be no guarantees of prices against market declines are contemplated by the National Association of Sheet and Tinplate Manufacturers, which includes in its membership many iron, steel and tinplate corporations in the U.S. Thousands of letters have already been sent out to sheet buyers in the U.S. and Canada calling attention to a resolution recently passed prohibiting guaranteeing prices.

The new contract contemplates an irrevocable sale and purchase not subject to cancellation, postponement of delivery or price revision because of market conditions. Freights are to be paid in cash and not subject to discounts. In order that its business may be legally carried on, the association to-day gave notice that it would apply to the courts on Nov. 8 for a charter.

CANADIAN COMMERCIAL INTELLIGENCE SERVICE

The Department of Trade and Commerce invites correspondence from Canadian exporters or importers upon all trade matters. Canadian Trade Commissioners and Commercial Agents should be kept supplied with catalogues, price lists, discount rates, etc., and the names and addresses of trade representatives by Canadian exporters. Catalogues should state whether prices are at factory point, f.o.b. at port of shipment, or, which is preferable, c.i.f. at foreign port.

EXHIBITION OF ENEMY SAMPLES

THE exhibition of enemy samples which opened in the Convocation Hall Building, Toronto University, last Monday will continue until Monday, Nov. 6. The exhibition is open to the general public and large crowds will no doubt avail themselves of the opportunity of carefully examining the goods. The object of the exhibition is to give Canadian manufacturers an opportunity of ascertaining whether any of the goods on exhibition can be made in Canada either for the home market or for export. The Department of Trade and Commerce invites all manufacturers to attend, whether they have received special invitations or not. It will only be necessary to register the name of the manufacturing firm represented to obtain admission. Manufacturers who wish to have the samples examined by expert workmen can secure tickets of admission for them on application to officials of the Department of Trade and Commerce at the exhibition. Wholesale merchants will also be welcomed.

These samples were collected in many countries by the British Government shortly after the outbreak of the war and were exhibited in all the important industrial centres of the United Kingdom. Wherever they were shown the manufacture and export merchants showed great interest in them. On the occasion of Sir George Foster's recent visit to England he arranged to have the samples brought to Canada and exhibited at the expense of the Department of Trade and Commerce.

Some of the samples are so inferior in quality that it would not be worth while for Canadian Manufacturers to attempt to compete with Germans in making them. Canadian manufacturers can however decide for themselves what articles among them it would be worth while to make in this country. An examination of the samples may suggest ideas of value even in cases where it is not considered advisable to make the same things.

Herbert Kershaw, one of the best informed officials of the British Board of Trade, has come to Canada in charge of the samples and will be glad to answer questions of visitors at the exhibition. Officials of the Department of Trade and Commerce will also be present to give information. The exhibition is in Examination Hall at the back of Convocation Hall Building.

There are 8,000 German and Austrian made articles in the exhibit which were bought in the open markets of the world. Wherever possible, each article has the wholesale and retail price, place of purchase, and other details affixed. The articles shown are of great variety and include the following classes of goods:—Textiles, soft and hard haberdashery, fancy and leather goods, glassware and crockery, hardware, enamel goods, aluminum ware, etc., tools, cutlery and electro goods and numerous miscellaneous lines.

The hours during which the exhibition is open each weekday, are from 10 a.m. to 6 p.m. On Thursday and Friday, this week and next week, it will be open until 9 o'clock p.m. to permit industrial workers who may not have the opportunity of getting out during the day to attend in the evening.

* * *

WHAT HAS BEEN WASTED

THE second report of the Committee of Public Accounts issued as a White Paper recently, shows a net deficit on the naval accounts of $258,759,310, and on army accounts of $1,059,337,705. The round total of the two is $1,318,100,000. In the economies effected is a saving of $15,000,000 on jute sand bags. The Ministry of Munitions had effected substantial reductions in prices for equipment, guns, etc., as compared with the early stages of the war, notwithstanding increased cost of labor and materials. The Admiralty had recently placed orders for shells, the price to be settled later, and were employing accountants to investigate the books of the firms as to the actual cost. It was regretted that no such system was adopted before the war in order to break down rings among contractors or to enable economies such as were being effected by the Ministry of Munitions.

As regarded army supplies, after some difficulty a system was evolved in June, 1915, for securing such supplies as were required at prices which were fair and reasonable in the interest of the public. This system was rendered more effective by the legislation in February last, which had the effect of breaking up and preventing a combination of manufacturers against the Government. They had taken control of whole trades, and thereby effected great economies in such necessaries as leather and jute. The committee hoped that the experience gained and the organization instituted for dealing with this aspect of the nation's affairs would not be lost sight of on the conclusion of peace. They hoped the Admiralty and the War Office would henceforth unite in efforts to effect national economy in the buying departments. The cost of hiring ships for detaining alien prisoners has been £450.000.

The committee regretted no organized system existed for the prevention of waste in the food supply to the troops, but this defect was being remedied. They also regretted that arrangements were not made to prevent the payment of undue brokerage commission on the purchase of stores. The committee were informed that sites for all camps, some of which had been regarded as unsuitable, were chosen for military reasons. The committee intimate approval of an Excess Vote for both naval and army deficits. The committee state that the payments in connection with the purchase of sugar at March 31, 1915, amounted to $93,000,000, and the amount received in respect of sales was $57,470,000. The balance was represented by stocks of sugar to a much greater value. The committee are informed that if all sugar were now realized a profit of something like seven and a half million dollars would be made.

* * *

SIX MONTHS' TRADE OVER BILLION MARK

THE hundred per cent. increase in Canadian trade for five months, as shown in the September statement, has been maintained, the total trade of the Dominion for the first six months of the fiscal year being well over the billion-dollar mark.

The monthly return issued under the direction of the Minister of Customs shows an increase from $92,487,862 to $161,797,951 in September, bringing the grand total for six months up to $1,148,899,412, as compared with $559,533,363 in the corresponding period of the previous fiscal year.

The Customs revenue in this period has risen from $44,421,033 to $70,102,854.

Excluding coin and bullion, the September imports amounted to $68,796,262 compared with $38,030,320 in September of last year. In the six month period the imports have reached a total of $390,995,243, an increase of $177,402,724.

Exports of domestic products, exclusive of coin and bullion, have more than doubled in six months, the figures being $536,721,514, and for last year, $246,392,148. September exports amounted to $90,285,181, a gain of $44,155,446.

The export expansion is found chiefly under the heads of agriculture and manufactures, the increase under the former being from $11,139,935 in September, 1915, to $25,164,034. Exports of manufactures in September increased from $9,244,974 to $37,801,177. In the six month period these exports were, agriculture $206,141,326 a gain of $146,794,343, and manufactures $190,823,240, a gain of $119,346,421. Exports of forest and fishery products declined slightly during September.

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News

Engineering

Mimico, Ont.—The Dominion Abrasive Wheel Co. will build a factory here.

Rainy River, Ont.—Blackmore Bros. will build a machine shop at a cost of $15,000.

Toronto, Ont.—John Inglis & Co. will erect an addition to their forge shop at a cost of $7,000.

Lindsay, Ont.—Fire on Oct. 17, destroyed the office and plant of the Machine Automatic Telephone.

Kitchener, Ont.—The Canadian Blower & Forge Co. will build an extension to their machine shop, to cost about $100,000.

Galt, Ont.—Wells Brothers, of Canada, Ltd., manufacturers of taps and dies, will build an addition to their plant to cost $2,000.

Toronto, Ont.—The Willys-Overland, Ltd., are making repairs and preparing for extensions at their West Toronto plant as rapidly as possible.

Renfrew, Ont.—M. J. O'Brien, of this town is proceeding with the construction of a hydro-electric power plant at Calabogie near here, at an estimated cost of $150,000.

Port Colborne, Ont.—The Foundation Co., who have the contract for the new nickel refinery are getting their plant together ready for starting work on the foundations.

Port Moody, B.C.—The Port Moody Steel Works, Ltd., is now making merchant bars, and proposes to install larger mills after the two open-hearth furnaces now under construction are in operation.

Port Arthur, Ont.—The first unit of the proposed pulp and paper mill to be built here will cost about $500,000 while the plant when complete will represent an investment of $1,000,000. A. G. McIntyre is consulting engineer.

Victoria, B.C.—Permission has been granted to McCarter Bros. to build a corrugated iron shingle mill at the foot of Rock Bay Avenue. The owners promise that combustion chambers of such a type will be used to fire the boilers as will prevent any charred sawdust nuisance.

Welland, Ont.—Judge Wolfe of New York and Eugene F. Diener of Dunnville, Ont., were in Welland recently in connection with plans which are shortly to be carried out to manufacture gasoline in Canada. A site has already been purchased in the Township of Canboro, 5 miles north of Dunnville.

The British Columbia Copper Co. is installing a pumping plant to elevate the water from the Similkameen River to a distributing point 1,700 feet above the river through a pipe line 6,000 feet long. The equipment will consist of triplex pumps, and the pump line will be composed of 4-in. high-pressure hydraulic pipe in the lower station and steel pipe of 6-in. diameter at the discharge. The water will be used to supply the mine, the camp, and a 50-ton experimental mill, which will be used for the working out of a concentration process preliminary to the erection of a 2,000-ton plant on the Similkameen River.

General Industrial

Montreal, Que. — The St. Lawrence Brewery Co., will build an extension to their brewery.

London, Ont.—Fire on October 19 destroyed the William A. Jenkins Mfg. Co. factory, causing a loss of approximately $30,000, which is covered by insurance.

Belleville, Ont.—Frankford cheese factory was totally destroyed by fire on Oct. 18. The entire loss will exceed $8,000, with only $4,000 insurance $3,000 on the building and $1,000 on the contents.

Owen Sound, Ont.—It is reported that a new industry for Owen Sound is under consideration. Mr. Menzies of the Board of Trade is negotiating with the syndicate which is interested in the proposition.

Trenton, Ont.—The Benedict Co., manufacturers of silver plated ware of Syracuse, N.Y., are fitting up the factory lately occupied by Lloyd and Sons, and will manufacture here for their Canadian trade.

Niagara Falls, Ont.—The Perfection Tire Co., are ready to go ahead with the erection of their factory. Satisfactory arrangements will be made to give the company power concessions promised by the municipality without violating Hydro rates or selling power below the price determined by the Commission.

Collingwood, Ont.—Fire on Oct. 18, destroyed the large coldstorage building and receiving warehouse of the Dominion Fish Co., situated on the wharf of the G.T.R. The loss will be several thousand dollars, on which there is said to be some insurance, held by the Booth Fish Co., Chicago.

Municipal

Regina, Sask.—The City Council will build a new pumping station at Boggy Creek.

Smith's Falls, Ont.—Town Council is considering the construction of a filtration plant, at an estimated cost of $20,000.

Shallow Lake, Ont.—A by-law will be voted on by the ratepayers on October 30 to endorse a loan of $4,000 to the R. Caesar Woodworking Co.

St. Romuald d'Etchemin, Que.—It is proposed to make improvements to the waterworks and sewage systems. A by-law to raise the necessary funds will be submitted on October 30.

Electrical

Wainwright, Alta.—The Town Council will install an electric light and power system. The B. L. Perry Co., of Edmonton will do the work.

Dublin Township, Ont.—The Township Council will shortly submit a by-law to authorize the installation of a hydro-electric system at an estimated cost of $5,000.

Building Notes

Toronto.—Smith Bros. have taken out a permit for a paint shop at 175 Duke street to cost $8,000.

Trenton, Ont.—The Board of Education have decided to erect a new High School in East Trenton to cost $3,600.

Toronto. — The Canadian National Carbon Co. have taken out a permit for a three-storey factory on Paton road, to cost $23,402.

Vancouver, B.C.—A permit for the construction of Pantages Theatre has been issued by building inspector McKenzie. The new vaudeville house which

Wood-Working

St. John, N.B.—The St. Stephen Lumber Co.'s plant at St. Stephen has been destroyed by fire. The loss will be about $100,00.

Penticton, B.C.—F. Demuth's lumber mill at Milford, on the Kettle Valley Railway, 40 miles from here, was burned down on October 14. The cause of the fire is unknown.

Tillsonburg, Ont. — Fire totally destroyed the box factory of James Trevail & Son of South Middleton on Oct. 17, together with the house and contents. The loss will be very heavy but is partly covered by insurance.

Tillsonburg, Ont.—The box factory of James Trevail & Son, of South Midleton, was destroyed by fire of an unknown origin on October 17. The loss will be heavy, with only $1,000 insurance on buildings and contents.

Deseronto, Ont.—The by-law giving the Dominion Hardwoods, Ltd., free water, and exemption from taxes, except school and war taxes, for ten years, was carried on Oct. 16, by a vote of 350 for and 4 against.

St. Stephen, N.B.—Haley & Sons' lumber and planing mill was totally destroyed by fire on October 17, together with thousands of dollars' worth of lumber. The plant was valued at about $100,000, and is practically a total loss, with $58,500 insurance. Messrs. Haley will rebuild and in the meantime they will run their Calais box and lumber mill day and night to fill their orders.

Tenders

Toronto.—Tenders will be received by the Chairman, Board of Control, City Hall, up to October 31, for the supply and delivery of the following:—Brass and bronze castings; brass work for house services, cast iron pipes, hydrants; pipe fittings and valves, supply of lead pipe, special castings, stop valves, iron castings of manhole, gullies grates, etc., general supplies and tools, iron and steel, house numbers, oils, lubricating, rubber valves. Specifications and forms of tender may be obtained at the Works Department, Room 12, City Hall.

Hawkesbury, Ont.—The Town Council is calling tenders for one electrically-driven turbine pump of 1,000,000 gal. per day capacity, direct connected to a 100-h.p. motor; one pump of 750,000 gal. per day capacity, with 75-h.p. motor, and for one pump of 500,000 gal. per day capacity, with 50-h.p. motor. M. Gareau is town clerk.

Toronto, Ont.—Tenders will be received by Frank Barber, engineer of the Township of York, up to October 30, for the supply and delivery of the following material:—Tender A-1—for supply and delivery of approximately 20,500 ft. of 24 in. cast iron pipe; A-2—for the supply and delivery of cast iron pipe (12 in. and smaller sizes); B-1—for supply and delivery of 24 in. special castings; B-2—for supply and delivery of special castings, 12 in. and smaller sizes; C-1—for supply and delivery of 24 in. valves; C-2—for supply and delivery of 12 in. and 6 in. valves; C-3—for supply and delivery of air valves; D—for supply and delivery of hydrants; F—for supply and delivery of tops, covers and plugs. Plans and specifications may be obtained at the office of Frank Barber, engineer, Toronto.

Ottawa, Ont.—Tenders, addressed to J. W. Pugsley, secretary of the Department of Railways and Canals, Ottawa, Ont., will be received up to November 15 for the construction of a reinforced concrete elevator with a capacity of 500,000 bushels. Plans, specifications and blank form of contract may be seen at the office of the following:—Chief engineer, Department of Railways and Canals, Ottawa; railways, Moncton, N.B., general superintendent, Winnipeg, Man.; resident engineer, Fort William, Ont.; John S. Metcalfe Co., engineers, Montreal, Que. Contractors who wish to obtain plans and specifications temporarily for their own use may obtain same on depositing a certified bank cheque for $100.

New Incorporations

Henden Lumber Co. has been incorporated at Toronto with a capital of $500,000 to carry on a sawmill and planing mill business, Timmins, Ont. Incorporators F. Austin Daly, W. Aston Gordon and Peter MacLeod all of Haileybury, Ont.

American Linseed Co., has been incorporated at Ottawa with a capital of $40,000 to operate elevators and to manufacture linseed oil, cake and other products at Winnipeg, Man. Incorporators, A. P. Allensworth, H. P. Grundy and F. W. Louthood all of Winnipeg.

Canada Gelatine Co., has been incorporated at Ottawa with a capital of $250,000 to manufacture glues, gelatines of all kinds and chemical fertilizers at Brantford, Ont. Incorporators Lloyd Harris of Brantford, George Upton and Jesse Lyman of Boston, Mass.

Contracts Awarded

Dundas, Ont.—The John Bertram & Sons Co. has let the contract for the erection of a pattern shop to E. G. M. Cape & Co., of Montreal.

Lethbridge, Alta.—The contract for a filtration plant has been awarded to the Roberts Filter Mfg. Co., Darby, Pa., Approximate cost, $100,000.

Assinboia, Sask.—The general contract for the construction of a waterworks system has ben awarded to M. S. Holmes, Souris, Man. Approximate cost, $68,000. Consulting engineers. Murphy & Underwood, Saskatoon.

Quebec, Que.—Price Bros. have awarded contracts to the S. Morgan Smith Co. for three turbines for their mill at Rimouski and three turbines from the same concern for the pulp mill at Jonquiere, Que.

Marine

Vancouver, B.C.—The C.P.R. propose extending the passenger pier at this port approximately 400 feet.

Halifax, N.S. — The North Atlantic Fisheries, Ltd., of this city has sold its Port Hawkesbury plant to Leonard Brothers, of Montreal and St. John.

St. Lawrence River Low.—Word was received at Kingston recently, that the water is very low below Iroquois. being some five inches under the usual vessel draught of 14 ft.

Vancouver, B.C.—Captain F. R. Dedrick, on behalf of the Stolt Nielsen Co., has signed contracts for the construction in Vancouver of three steamers for his Norwegian principals. The vessels are to be standard type freight carriers of 8,800 tons, costing $1,225,000 each.

Ottawa, Ont.—The Trade and Commerce Department announces that the Cunard Steamship Co. have chosen Halifax as their Canadian winter port for the new steamship service to be established between Bristol and Canada. Their steamers will call at both Halifax and New York on east and west-bound voyages.

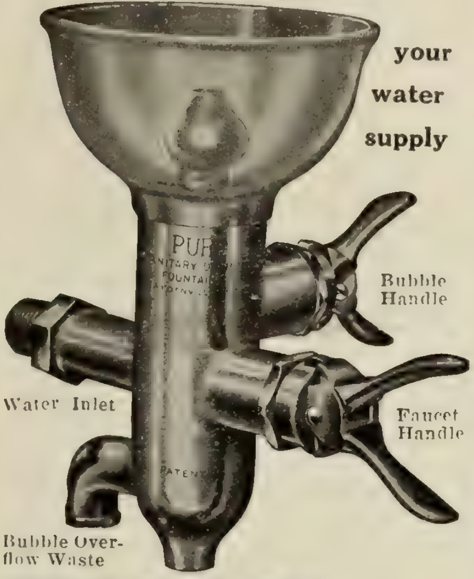
"PURO -FY"

(MADE IN CANADA)

your water supply



THE American Museum of Safety conferred a Gold Medal Award upon the Puro Sanitary Drinking Fountain at the First International Exposition of Safety and Sanitation.

The Puro Sanitary Drinking Fountain won because it deserved to win—Puro had merits that made it stand head and shoulders above any other drinking apparatus.

Safe **Simple**
SANITARY **Economical**
Quickly Attached

These are the qualities that forced the leading safety and sanitary engineers to pick Puro in preference to all others.

No device can be as efficient that does not contain all these qualifications; and Puro was not tied for first place; Puro was first.

Don't be satisfied with half-way goodness, or makeshift drinking arrangements for your employees.

If the men in your factory must drink, give them a clean drink.

Puro is clean—it does not rust or corrode.

Puro is economical. It allows just the proper amount of cool, clean, fresh water to come through the bubbler. No spurting, no overflowing, no loss. Puro regulates itself. You can attach it in five minutes.

Tell us how many men in your factory and your water pressure in pounds—

We'll tell you just what it will cost to "PURO-FY" YOUR WATER SUPPLY.

The Value of Multiplied Minutes

We'll suppose that you have 10 men using files, on an average of an hour a day in all 10 hours a day; or 3000 hours a year. Value in wages at 40 cents an hour,

$1200

Delta Files

will save 10% of man-time in the doing of a job.

It means that in a shop with only 10 file users you save $120 a year; or $12 per man.

It would pay the premium for example on a $2500 endowment life insurance policy.

Calculate this for a period of 10 years — for 20 years: and you have on a 10-man basis $12,000, or $24,000.

We leave it to you to say what a saving of $120 a year will pay—$10 a month.

This is what we say with our pen and with our money.

DELTA FILES will cut faster and retain their cutting edge longer than any other file made.

Skeptical? Challenge us to make good our claim.

If we are right the inference is obvious.

Send for a sample file to have it proven.

Great Lakes Water Impure.—Apparatus carried by Great Lakes steamers to purify lake water for drinking is described as 'woefully inefficient'' in a bulletin published by the Public Health Service, Washington, D.C. No purification method is in use by any steamer on the lakes, it is declared, which fulfils Federal requirements by ensuring safe water under all circumstances.

Merchant Shipbuilding. — A substan- increase in merchant shipping under construction in Great Britain for the three months ending October 1 is reported by Lloyd's. The report shows that on October 1st there were 46 vessels building, representing a total of 1,789,054. tons. This represents about 249,000 tons more than the amount under construction at the end of the previous quarter, and 253,000 tons more than that building a year ago.

Bunker Coal Prices.—The advance of 50 cents a ton to a rate of $3.95 in the price of fuel for steamers, announced by a leading shipper of Cleveland, O., has not been made general, and some of the coal men say they have not decided what action they will take along that line. Boat men claim that steamers carrying coal and ore at contract rates cannot stand the advance. At the rate operating expenses are being increased, vesselmen will be slow in making freight contracts for 1917, as boats carrying contract ore and coal are having pretty thin picking.

Vancouver, B.C.—If plans which are at present in contemplation go through successfully, orders for vessels will be placed with the Wallace Shipbuilding Co. on the north shore and with Messrs. Coughlan & Son at their proposed yard on False Creek. So far as Wallace's yards are concerned, it means the expenditure of between four and five million dollars, but with regard to Coughlan & Son, no definite figure has yet been mentioned. Otto Dohl, of Philadelphia, representing a Norwegian shipping syndicate, and Jesse Stearns, representing American capitalists, are here in connection with these schemes.

Anchor-Donaldson Line. — A new steamship company, to be known as the Anchor-Donaldson Line, organized by a fusion of interests of the established Anchor and Donaldson Steamship Co., has been organized for Glasgow—Canadian passenger and freight trade. Directors of both companies will be represented on the Board of the new company, with Sir Alfred Booth of the Cunard Line as Chairman. The steamers Letitia, Cassandra, Athenia and Saturnia, will be transferred to the new organization. The Donaldson Line is now operating a service between Liverpool, the River Plate and leading South American ports. It has a fleet of twenty-five ships, totalling 89,992 tons. The Anchor Line operates a passenger and freight service between Glasgow and New York, calling at Liverpool in conjunction with the Cunard service. It has a fleet of fifteen ships, with a total tonnage of 114,222 tons .

Railways—Bridges

Newcastle, Ont.—The ratepayers have voted in favor of an expenditure of $2200 for a new concrete bridge.

Victoria, B.C.—Tenders for the timber swing span for the reconstruction of the Rock Bay bridge have been opened as follows by the City Council, Clarence Hoard, $21,135; Charles M. Cookson and William Ross, $12,947; Watson, Hall & Huntley, $18,277; MacDonald, Middleton & Bruce, $15,500. The tenders have been referred to the city engineer and the harbor committee.

Personal

J. F. S. Madden, formerly manager of the Canadian General Electric Co. at Winnipeg, has been promoted to the head office at Toronto.

Lieut. C. A. Page, sales manager for the Canadian Hart Wheels, Ltd., Hamilton, Ont., has received an appointment with the 164th Battalion C.E.F., and expects to go overseas shortly.

F. W. Blythe, district manager of the Canadian Allis-Chalmers, Ltd., at Winnipeg, has been promoted to the head office at Toronto.

Col. Thomas Cantley, president Nova Scotia Steel & Coal Co., New Glasgow, N.S., has been elected a director of the Institute to fill the vacancy caused by the death of Thomas J. Drummond.

W. C. Hawkins, of Hamilton, Ont., managing director of the Dominion Power & Transmission Co., and **F. W. Teele**, of Boston Mass., formerly vice-president and general manager of Porto Rico Railways Co., have been elected to the board of Southern Canada Power Co.

Sir William Benjamin Bowring, Bart., of Liverpool, a ship owner, is dead. Sir William Bowring was one of the best known shipping men of England, and was identified with marine interests in Newfoundland and New York. He was born in St. John's, Nfld., in 1837. Sir William was chairman of C. T. Bowring & Co., of London, Liverpool, and Cardiff, and a director of Bowring Brothers, of St. John's.

W. M. Ackworth of London, Eng., will be appointed a member of the Railway Board of Inquiry, which is investigating the railway situation in Canada, in consequence of the resignation through ill health of Sir George Paish. Mr. Ackworth has had great experience in railway matters, having been a member of several commissions on railway questions in Great Britain, and he is the author of several works on the railways of the United Kingdom, upon railway economics.

R. F. Randolph, a steel expert who has been in the employ of the Bethlehem Steel Co. for the past seven years and was recently appointed general superintendent in charge of the steel plant by the Dominion Steel Corporation, has arrived in Sidney, N.S. and will immediately take up his new duties. Mr. Randolph is recognized as being one of the leading steel experts in America. Mr. Martin whom Mr. Randolph replaces, has resigned and it is understood, is leaving Canada.

Trade Gossip

Frank Martin, Canadian representative of Wm. Garthwaite, of Paris, managing director of the Marine Navigation Co., will open an office for the company at Halifax, N.S.

New Output of Customs.—Port Maitland, Ont., has been created an outport of customs and warehousing port under the survey of the port of Hamilton. A permanent harbor headline has also been established at that point.

Hamilton Brass Ltd., has taken over the business of the Hamilton Brass Mfg. Co., and will manufacture bib cocks, hose nozzles, couplings, etc. N. L. Bailey, formerly with the Tallman Brass & Metal Co., will be superintendent.

Labor Adviser to Munitions Board.—At the request of the Imperial Munitions Board of Canada, H. E. Morgan of the labor supply department of the Ministry of Munitions, London, has been temperarily detached by the Minister for the purpose of proceding to Canada to advise the Board on British procedure in regard to the labor in munition factories.

No Imports of Steel.—The London *Daily Chronicle's* parliamentary correspondent understands that the iron and steel sub-committee of Lord Balfour's committee, which was appointed to make recommendations on a basis of the Paris economic proposals, has presented a report urging prohibition of iron and steel imports into Britain after the war, during at least the period of demobilization and reconstruction.

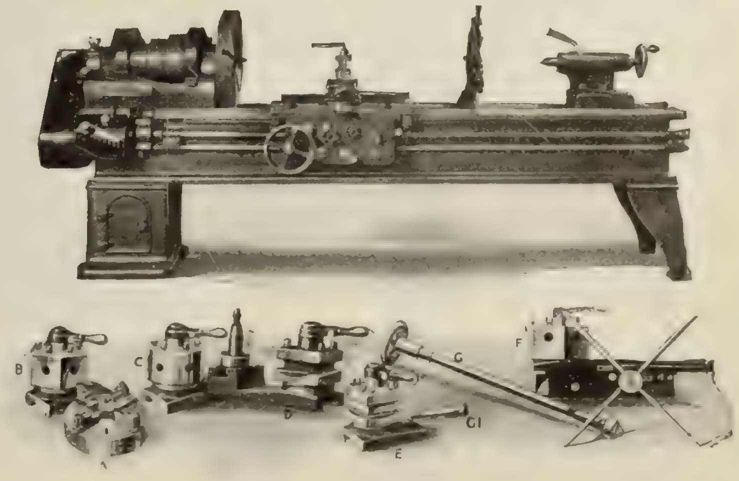
"PERFECTION"

THE NAME **THE DESCRIPTION**



Sizes 16x6, 18x8, 20x10

Edgar Bloxham, Inc.
Grand Central Terminal Building NEW YORK, N.Y., U.S.A.

Prices lower than any other lathe of same specifications because of volume of manufacture and fixed low percentage of profit over actual cost of production.

Will Report to Russia on Hydro.—A favorable and exhaustive report of the practical use that is being made of Hydro power by the farmers of Ontario province, particularly in Oxford and Waterloo Counties, will be forwarded to the Russian Government by Prof. Boris Bakhmeteff, of the Agricultural Department of the Electro Technical International Commission of Russia.

Vancouver, B.C.—Robert Dollar, head of the Canadian Dollar Co., steamship owners has bought the sawmill equipment of the Ruskin mill and intends to manufacture lumber for export through Vancouver. The mill, which was built and formerly operated by the E. H. Heaps Lumber Co., is one of the most modern mills in the coast district with a capacity of 100,000 feet of lumber and half a million shingles daily.

The Dominion Bridge Co., in conjunction with the Montreal Ammunition Co., and the Dominion Copper Products Co., are displaying at the electrical exhibition, Winnipeg several sizes of shells in the various stages of manufacture. The exhibit comprises complete and half sections of all shells, ranging from the 18 pound shrapnel and the 18 pound high explosive shell to the 6 and 9.2 howitzer shells. The cartridge cases for these shells are also on display, showing the various steps in their manufacture from the original brass disc. Included in the exhibit are 75 mm. shells which have been manufactured for the Russians.

Magazines as Packing—The Alexandria & Ramleh Railway Co., Egypt, calls attention to the inconvenience that may result from possible delay in withdrawing goods from the local customs, on account of the presence in cases containing merchandise of illustrated newspapers and magazines used as packing material. Exporters should be warned against using printed matter of any nature in packing merchandise intended for belligerent countries. An ulterior motive is always suspected when uncensored printed matter comes to a belligerent country through channels other than the public post.

Change of Firm Name.—The engineering work at the Provincial Hospital for the Insane at Whitby, Ont., which was designed by MacMullen, Riley & Durley. Constructing engineers Montreal and Toronto will be carried to completion by the firm of MacMullen, Riley & Angus who have taken over the unfinished work of the former firm. Mr. Angus whose name appears in the new organization is well-known in engineering circles in Toronto and has been for some years practising his profession in this city. The new firm will continue the design of heating, ventilating, plumbing and electrical equipment of buildings as carried on by them separately in the past and will also specialize in the building design and equipment of industrial plants.

Freight Embargo at Toronto.—The inability of the railways and the teaming companies to obtain ample labor has forced the G.T.R. to place an embargo against less than a carload of freight from all points consigned to Toronto. The C.P.R. also had an embargo which became effective on October 9th, but they have been able to check up their congestion in the local freight sheds, with the result that the embargo has been discontinued. If the company finds it impossible to keep pace with the enormous volume of freight moving, the order will be restored. The embargo placed by the Grand Trunk is applied to all freight less than a carload, except perishable goods and munitions. The Toronto terminals are congested with freight, much of which cannot be delivered.

C.M.A. Maritime Branch Convention—The Convention of Maritime Province manufacturers held in New Glasgow, N.S., towards the end of last week may be said to have more than fulfilled the highest expectations of its promoters in every direction. Considerable interest was shown by those present in the work of constructing locks on the East River for the improvement of ocean vessel navigation, and in the scope and variety of work being undertaken at the plants of the Eastern Car Co., and Nova Scotia Steel & Coal Co., New Glasgow. Among those who addressed the Convention sessions were G. M. Murray, secretary the Canadian Manufacturers' Association, and Hon. Geo. H. Murray, Premier of Nova Scotia. "Development of a Canadian Mercantile Marine," and "Development of our Resources" were the subjects discussed by these gentlemen respectively.

Catalogues

Planing Machine. — Joseph Appleyard, Bradford, Yorks, England, has issued a leaflet dealing with a side planing machine. The machine is illustrated and described while testimonials are also included.

Laundry Machinery.—Two bulletins issued by Joseph Applevarl Bradford, Yorks, England, deal with an extensive line of laundry machinery. Each type of machine is illustrated and described while shipping weights and prices are also given. A number of testimonials are included.

Book Review

Railway Organization and Management, by James Peabody, lathe statistician, Atchison, Topeka & Santa Fe Railway. A clear and usable book on this subject has long been needed and Mr. Peabody's attractive volume will be found more than adequate. His position as chief statistician of the Santa Fe system gave him unique opportunities for collecting material, and he proved himself capable of scholarly and interesting presentation when, shortly before his death, he wrote this book. "It is not surprising," he remarks in the introduction, "that the railroad organization to the uninitiated seems to be bound round and round with an endless amount of red tape, exhausting patience and trying and expensive; whereas if the organization were properly understood and the activities of each department borne in mind, this seeming overcomplexity would disappear. "Railway administration involves so many and such widely varied subjects as to require for its successful conduct the largest possible survey as to commercial conditions, coupled with a knowledge of detail that takes into account all the varied operations incidental to the service. Properly to manage such an undertaking necessitates the employment of many men of many minds, and the plan by which homogeneity and efficiency are attained is known as railway organization." The various departments are taken up in order, administration, engineering, operation, traffic, accounting, etc.—and the work of each and the arrangements for performing that work are clearly set forth. No such complete list and description of railway positions had been put into any previous work. Elaborate charts show the relations of the officials to each other and guide the reader through the almost infinite complexities of the organization. The book also discusses in a most interesting fashion the problems of all kinds which railroad men have to meet, from the occasional vagaries of law makers to the scarcity of wood for ties. Such vital topics as government regulation, valuation, education of apprentices, pensions, staff versus line control, reports, statistics, advertising, competition, track elevation, electrification, traffic associations, rate-making, interline billing, the management of great terminal stations, all have concise but illuminating treatment. So wide is the range of subjects and so incisive the handling of them that the volume may well be called the most attractive general introduction to the business of railroading that has yet been published. The book is issued by the La Salle Extension University, Chicago

QUANTITY PRODUCER

This tool is used in shops where parts are keyseated by thousands. It is fitted with a high-speed steel rotary cutter for milling internal keyseats in one cut. Shops large and small can use the tool, and it is readily attached to a drilling machine for which it is designed. The tool keyseats in places where Keyseating Machine, Planer and Shaper can't reach. The right tool to use for keyseating interchangeable parts. There is no limit to the variety of work possible to be keyseated.

To Investors

THOSE WHO, FROM TIME TO TIME, HAVE FUNDS REQUIRING INVESTMENT, MAY PURCHASE AT PAR

DOMINION OF CANADA DEBENTURE STOCK

IN SUMS OF $500 OR ANY MULTIPLE THEREOF.

Principal repayable 1st October, 1919.

Interest payable half-yearly, 1st April and 1st October by cheque (free of exchange at any chartered Bank in Canada) at the rate of five per cent per annum from the date of purchase.

Holders of this stock will have the privilege of surrendering at par and accrued interest, as the equivalent of cash, in payment of any allotment made under any future war loan issue in Canada other than an issue of Treasury Bills or other like short date security.

Proceeds of this stock are for war purposes only.

A commission of one-quarter of one per cent will be allowed to recognized bond and stock brokers on allotments made in respect of applications for this stock which bear their stamp.

For application forms apply to the Deputy Minister of Finance, Ottawa.

DEPARTMENT OF FINANCE, OTTAWA,
OCTOBER 7th, 1916.

Who is Your Customer ?

THE finding, holding and multiplying of customers is your great business—probably your great problem. There's no royal road—no priceless route—to them. The plain way to find, interest and persuade them is the well-traveled way, the way of Public Advertising.

But the ideal medium—what is it?

If you are seeking a single medium of potency, of prestige, of sufficient circulation, you will find it in

MACLEAN'S MAGAZINE

You know of this magazine, but do you know it through use?

It can't do everything, but it can do much. It can make your product, commodity or service known nationally—and this at small cost per annum.

N.B.—Objectionable advertising not accepted. Both editorial and advertising columns are closely censored to keep them clean and decent.

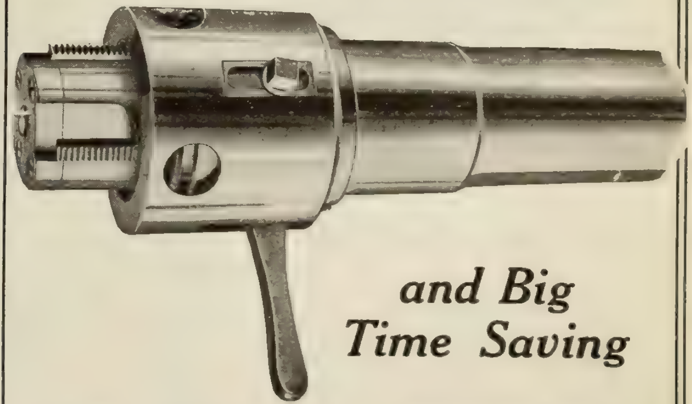
For Positive Accuracy—



and Big Time Saving

VICTOR Collapsible TAPS

"Victor" Collapsible Taps are simple in construction: the few parts can be made large and strong; the body is machine steel, and the chasers are high-speed; screw adjustment from front end makes it easy to maintain close accuracy; trip is automatic; reset by means of lever. The above features and others—make the "Victor" a time and money saver for severe service. It is being used by many shell manufacturers.

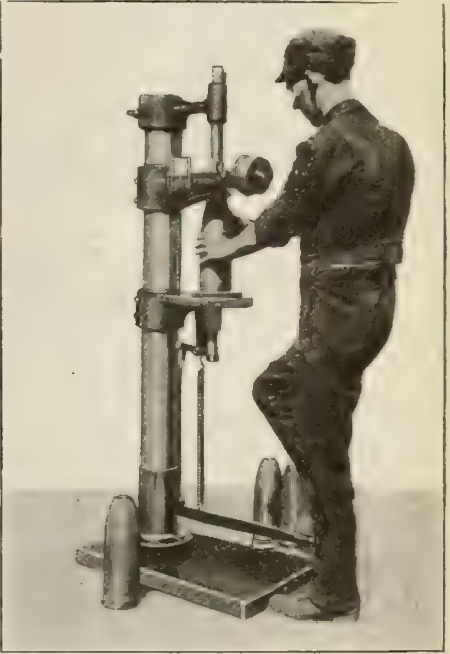
MONARCH
Milling Machine
(Made in Canada)

For Milling the three slots in the nose of

Mark 7 Shells

Adjustable to take any size shell from 4.5 to 9.2 inclusive.



ONE MOVEMENT of foot lever clamps the shell and feeds the three cutters in to the right depth.

CAPACITY ON 4.5—6 to 8 shells per minute. Actual cutting time is simply -- "zip" and the three slots are finished.

THE MACHINE is complete with High Speed Cutters and drive pulleys which should run at about 550 revolutions per minute. It can be driven by three 2-inch belts, either from overhead counter or line shaft. The clamping device does not interfere with copper band, and altogether it will be found to be a very satisfactory tool—CONVENIENT and ACCURATE.

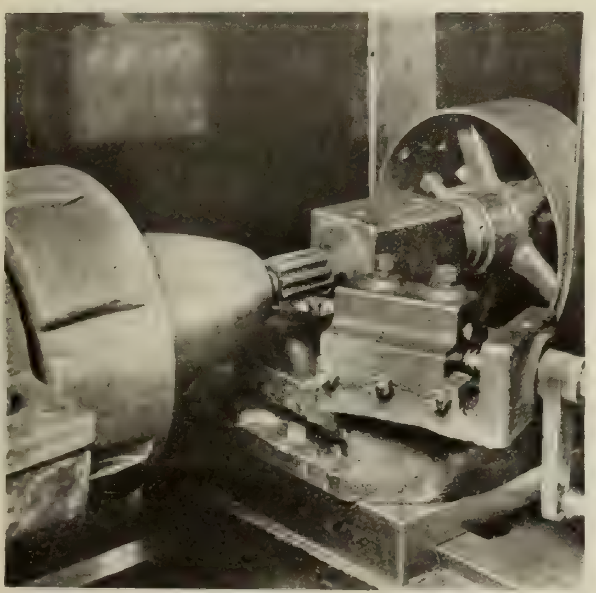
4.5 Mark VII Plant For Sale

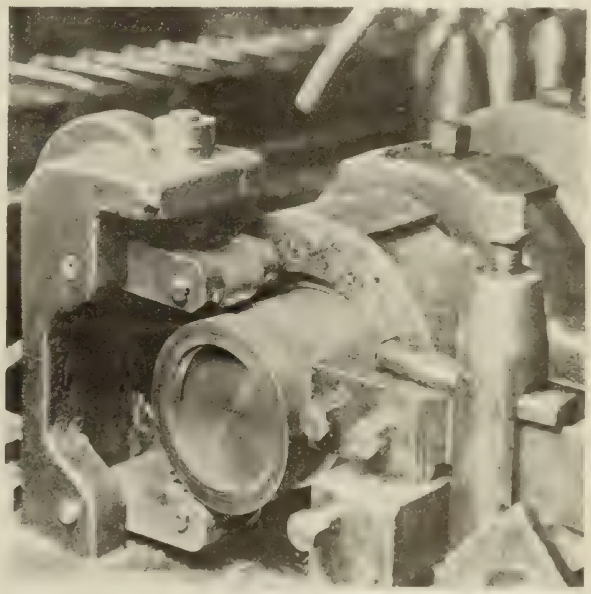
Immediate Delivery

The following machines have been changed from the mark V shell to the mark VII. We will dispose of these machines with their tooling. Every machine has been examined and put into first-class shape.

2—30" American Turret Lathes, Triple Geared; 36" turret base; will take both 3" and 4" boring bars; extension heads on turrets; special small turret or cross-slide with six 1½" holes; 20" 3 jaw Universal steel chucks; Power Feed and Power Reverse. All tooled, boring bars, pot chuck, etc., each	$1300
2—24" Morse Turret Lathes; with 3-jaw Universal chuck; 16" base turret having six 3" holes. All tooled, with pot chuck, for hogging-out base of Mark VII. shell, each	$800
1—Jenckes Band Turning Machine; collet chuck. This machine has band-turned about 15,000 shells. All tooled for Mark VII. shells	$900
1—24" x 12 Bertram Engine Lathe, all tooled with special milling fixture for threading the base recess of Mark VII. shell	$900
1—24" Morse Special Turret Lathe; carriage feed; all tooled with pot chuck and forming tool for finish base recess of Mark VII. shell, each	$900
1—Special Painting Machine, with 110 volt alternating current motor	$50
1—150-ton Hydraulic Nosing Outfit, consisting of 1 Triple Action Pump (Perrin); 1 Accumulator (Perrin); 1 Nosing Press (Perrin), with Mark VII. die complete; 1 Chapman Banding Attachment for Press	$1075



The only correct time to perform the seating operation is to do it in the same fixture with the milling operation This fixture will fit any engine lathes, and costs only $120.00, including milling, cutter and seating tool. The angle of seating can never vary.



Most of the British Shells may now be knurled. This fixture is quick in operation and most accurate. The cost is only $100.00, and it can be used as an attachment to almost any lathe.

We have all gauges for both Mark V and Mark VII Shells, consisting of plug, length, outside diameter, form, thread and seating gauges.

Our Nosing Die Outfit is the best for the Mark VII shell. Leading manufacturers, such as P. L. Robertson Co., Milton; Wilford & Co., Lindsay; Manitoba Engines, Ltd., Brandon; Canadian Westinghouse, Hamilton; Vancouver Engineering Works; Vulcan Iron Works; Otis Fenson Elevator, etc., are using our dies.

WHETHER YOU USE COAL, GAS OR OIL FUEL

We can save money for you. Rockwell service is based on many years of experience, in this specific line. We will make inspection of your plant, devise methods and means of working, prepare plans, furnish complete industrial furnace equipment and guarantee results regardless of the kind of fuel you use. Your best interest is our only consideration. We cannot lower the cost of your fuel but we can help you to get more out of it.

DRILLING

LIKE ANY OTHER OPERATION GAINS IN SIMPLICITY WHEN THE TOOLS ARE EFFICIENT.

"MORSE" DRILLS

IN YOUR SHOPS WILL SIMPLIFY YOUR DRILLING MORE THAN MOST.

CATALOG ON REQUEST

MORSE TWIST DRILL & MACHINE COMPANY

NEW BEDFORD MASS., U.S.A.

A Wonderful Combination in Riveting

Speed—

One rivet per second.

Uniformity—

Each rivet headed with same degree of tightness or looseness as desired.

Finish—

Perfectly formed rivet heads, highly polished surface. No hammer or tool marks shown.

Grant Noiseless Rivet Spinning Machines are the only machines built that will accomplish the above.

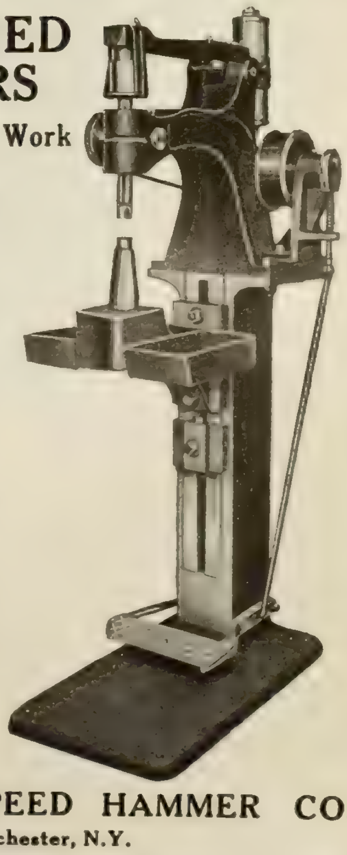
Catalog ?

The Grant Mfg. & Machine Co.

Holland Ave.
Bridgeport, Conn.

HIGH SPEED HAMMERS

For High Speed Work



FEATURES:

Economy in floor space, elimination of weight and a guaranteed saving of from 15% to 20% on any class of work. The life of the machine is practically indefinite as phosphor bronze bushings are used throughout.

No riveting too intricate for us; no riveting which our machine cannot accomplish.

Send for our High Speed Hammer Book.

"DIAMO-CARBO"

You can make your dull or coated grinding wheels like new in efficiency by dressing them with

DESMOND-STEPHAN
GRINDING WHEEL DRESSERS

and you will eliminate delayed production and lost time, due to the loss of their cutting properties.

Insist upon having your dealer supply you with one of our tools for trial. If he cannot, write us, and we will send any of them on approval.

The Canadian Desmond-Stephan Mfg. Company
HAMILTON, ONTARIO

Our **"Diamo-Carbo"** Dressers are the economical substitute for the Black Diamond Dressers. They are so low priced that each grinding stand may be provided with its own dresser.

Our **"Sherman Huntington"** Dressers are for use on large and coarse wheels upon which the Diamond cannot be used. It is the most satisfactory Dresser ever designed.

"SHERMAN-HUNTINGTON"

Alfred Herbert, Ltd., Coventry, Agents for Great Britain.

Don't Keep It--Sell It!

If you have a lathe
a drill
a milling machine
a planer
a chain block
a chuck
a motor
a crane
a stock of belting
an engine
a compressor

or any other machine shop equipment for which you really have no further use, why not turn it into *cash?*

Someone may be looking for just the machine you may want to sell. Let us bring you together.

A "classified" ad. in CANADIAN MACHINERY, costing a few cents per issue, has done wonders for others. Why not try it?

"Keystone Quality"

KEYSTONE—WESTON

"KEYSTONE" Weston Ratchet

For Square Shank Drills Only.
STRONGEST RATCHET MADE.
Fully guaranteed.

The Name or Mark—"Keystone Quality" on a tool is "Nuffsed." It stands for perfection in everything—design, function, material.

"Keystone Quality" tools are supplied by all better class supply houses. Write for name of nearest dealer.

**THE KEYSTONE MFG. COMPANY,
BUFFALO, N.Y.**

THE KEYSTONE MFG CO.
WESTCOTT

**The Original
"WESTCOTT" Adjustable "S" Wrench**

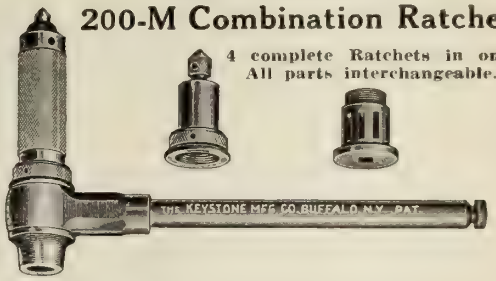
HANDLE MALLEABLE IRON, JAW FORGED STEEL.

The "Westcott" Wrench is acknowledged to be the most convenient and useful wrench for general use, and can be used in many places inaccessible to the Monkey Wrench. These wrenches are made of first-class material, are strong and durable.

The genuine "Westcott" Wrenches have the trade mark "Westcott" on the handle.

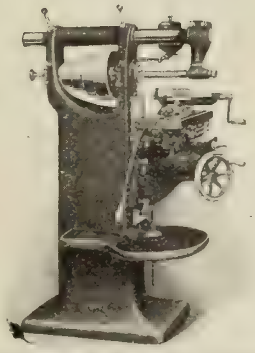
**"KEYSTONE"
200-M Combination Ratchet**

4 complete Ratchets in one.
All parts interchangeable.

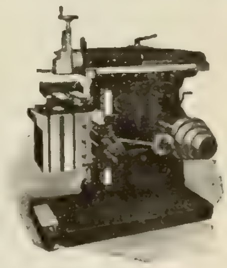


Increased Production Means Increased Profits

Large Millers for large work—STEPTOE MILLERS for small work.



Large Planers for large work—STEPTOE SHAPERS for small work.



Will result in increased production; less money invested in machinery, and increased profit.

THE JOHN STEPTOE COMPANY
CUMMINSVILLE, CINCINNATI, OHIO, U.S.A.

"STERLING" HACK SAW BLADES

will prove an economical investment. Give them a trial and be convinced.

MACLEAN'S

for NOVEMBER

WANTED—A NATIONAL ANTHEM. Perhaps you yourself have felt in these times of intense patriotism Canada's lack of a real National Anthem; and, if so, Arthur Stringer's magnificent presentation of Canada's need in the November MacLean's will make you say "Amen and Amen." : : : The problem of the returned Soldier—a phase of it—is the subject of a special article which has the sanction and approval of Sir James Lougheed, President of the Military Hospitals Commission; a contribution of genuine interest to all business men : : : Business men will be glad to learn that the fine monthly Business Outlook article is to be added to by a department headed "Information on Investments" : : : Another excellent and timely contribution is "Putting the Crop Across" — how Canada markets her wheat.

H. F. GADSBY writes on "Conserving the Conservatives"—a political article that both Liberals and Conservatives will find good reading : : : Peter McArthur, farmer-author, begins a series of stories in the November Number with "The Witch of Atlas"—extremely good : : : Robert W. Service has another "At the Front" poem—"Fleurette," strong yet tender : : : H. M. Tandy, a Canadian writer of fine ability, has a story, "Straw-Stack Strategy"—fine! : : : Serial stories by Arthur Stringer and Arthur E. McFarlane.

Using Them For Fifty Years

Many firms have been using the "Famous Five" Files for half a century.

Their efficiency has become a tradition, because the constant improvement of their cutting qualities has kept abreast of the demands of modern shop practice.

Specify them when ordering. They are:

KEARNEY & FOOT GREAT WESTERN
AMERICAN ARCADE GLOBE

Branches: New York, Pittsburgh, Detroit, San Francisco, Birmingham

---

For Rapid Production and Accurate Work

USE THE

"BRIGGS"

The Briggs Miller handles work no other machine of its size can touch. It is a manufacturing machine On account of its rigid construction it will produce accurate work when running at a high rate of speed and feed.

Fast

The Base Tank and Large Gear Pump is the latest addition to its many advantages. Tank holds 20 gallons of cutting lubricant.

Pump never requires priming and will deliver ten gallons per minute to the cutters, keeping them cool when run at very high speed.

Our booklet describes fully. Drop a card for it.

CLEVELAND HOSE SPECIALTIES

Bowes Automatic Air Hose Couplings

Over 1,000,000 in general use

STYLE O.F. is an Outside Thread Female Pipe End. Made in sizes ⅜-in. to 1½-in.

STYLE I.F. is an Inside Thread Female Pipe End. Made in sizes ¼-in. to 1½-in.

STYLE H.F. is a Female Hose End with spiral shank to insert into the hose and has groove for the Never Slip Hose Clamp. Made in sizes ¼-in. to 1½-in.

STYLE H.M. is a Male Hose End with spiral shank to insert into the hose and has groove for the Never Slip Hose Clamp. Made in sizes ¼-in. to 1½-in.

STYLE O.M. is an Outside Thread Male Pipe End. Made in sizes ⅜-in. to 1½-in.

STYLE I.M. is an Inside Thread Male Pipe End. Made in sizes ¼-in. to 1½-in.

The Male and Female Ends of Bowes Couplings interchange in sizes, ¼-in. to ¾-in. Sizes 1-in. and 1¼-in. interchange. The 1½-in. ends interchange only with themselves.

BOWES COUPLINGS

Are instantly connected or disconnected.

They are absolutely air-tight under all pressures.

They quickly pay for themselves by stopping costly leaks.

They interchange in sizes most commonly used.

They have no loose parts to be mislaid or lost.

They are made of brass and will not rust.

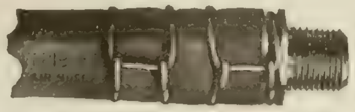
The U-shaped interchanges in couplings ¼-in. to ¾-in.

The Cleveland Never Slip Hose Clamp

Made in same sizes as Bowes Couplings

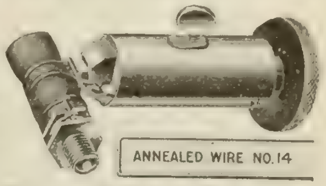
The adjoining cut of Never Slip Hose Clamp shows the "Flanges" which engages the groove provided in all hose ends of Bowes Couplings. The "Model Hose Line" illustrated shows correct styles of couplings to use and proper way to attach the clamps.

CLEVELAND GROOVED HOSE NIPPLE



Grooved Nipples when attached to hose with the wire clamp cannot "blow-out," as one half of the Wire Clamp lies in Nipple Groove, and the other half on the hose, uniting nipple and hose permanently. "Blow outs" are expensive, as one to five men are idle while new connection is being made; time wasted, ten to thirty minutes. Can you afford it?

WIRE CLAMP TOOL



To apply Wire Clamps to Grooved Hose Nipples you need the Wire Clamp Tool illustrated, a small hand-operated tool at moderate cost which we carry in stock for immediate delivery.

In Stock: Riveting and Chipping Hammers, Four piston Air Drills, Corner Drills, Emery Grinders, Sand Rammers, Holder Ons, Etc.

WRITE FOR BULLETIN NO. 29.

IMPORTANT:—The Small Leaks in your "AIR LINE" mean serious loss in DOLLARS. Have you any idea of the amount of "Air" wasted in small leaks at your connections? Air Leakage through 1-16 in. opening equals 5.32 cu. ft. per minute at 80 lbs. It will pay you to install Bowes Couplings and stop costly leaks.

Write for Catalog No. 12, which illustrates our complete line of Air Tools.

CANADIAN MACHINERY

AND MANUFACTURING NEWS

A weekly newspaper devoted to the machinery and manufacturing interests.

Vol. XVI. TORONTO, OCTOBER 26, 1916 No. 17

EDITORIAL CONTENTS

Machine Shop Equipment, Methods and Processes—II 435-437

General 437-438

War-time Uses of Forest Products....Meeting War Exigencies .... The Munitions Problem .... Scarcity of Wood Pulp....Big Development in Shipping Services.

Production Methods and Devices 439-442

Methods of Measurement for Expert Mechanics II .... Increasing Production .... Squaring a Small Die.

Editorial Correspondence 443-444

Machinists' Instruction Course—VIII....Reader's Query Solutions.

The Development of Irregular Sheet Metal Pipe Connections 445-446

Questions and Answers 446

Progress in New Equipment 447-449

Automatic Boiler Valve....Combination Threading and Cutting-off Machine....Improved Stacking Tote Box....Shell Boring Machine.

Editorial 450

The Decimal System in Currency, Weights and Measures.

Industrial Notabilities 451

Lloyd Harris.

Selected Market Quotations 452-454

The General Market Conditions and Tendencies 454-458

Montreal Letter....Toronto Letter....Exhibition of Enemy Samples....Six Months' Trade Over Billion Mark.

Industrial and Construction News (Advertising Section) 74

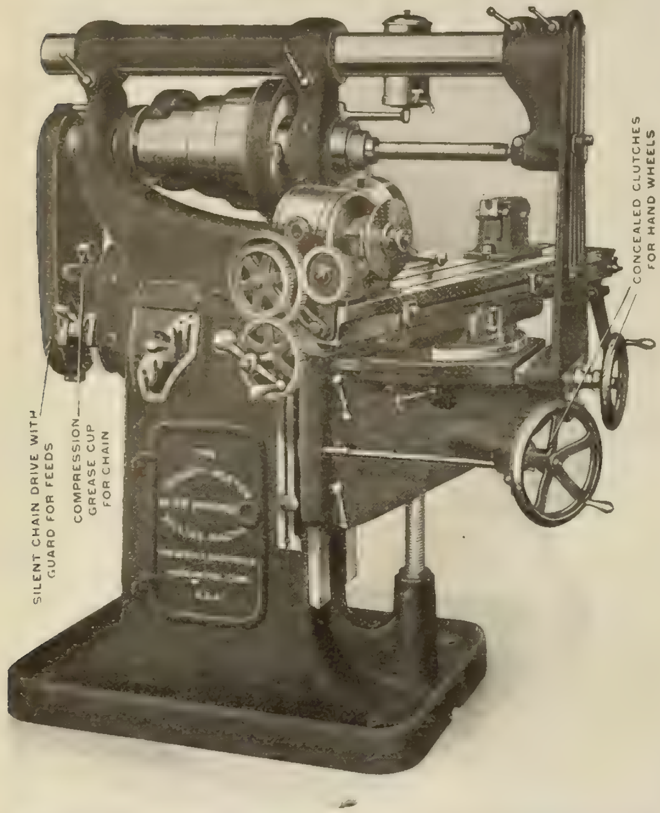
Hendey Millers will take any kind of a miller job

that comes into the modern shop



CONCEALED CLUTCHES FOR HAND WHEELS
SILENT CHAIN DRIVE WITH GUARD FOR FEEDS
COMPRESSION GREASE CUP FOR CHAIN

and it delivers the finished work in the highest degree of accuracy and perfection. It has a wide range of spindle speeds (16) and feeds (18).

The "Hendey" is free from the usual complicated features. All working positions are secured with but **few and easily understood movements** on the part of the operator. **Anyone can operate the "Hendey Miller."** No special skill is required to get the service that the Hendey's built for.

Write for the "Hendey Miller" Book. It is certain to interest you.

McDougall Shapers

ARE-MAC-DEE IS A GUARANTEE

These are up-to-date Shapers, designed for modern shop production.

They are plain in design, yet embody all essential features necessary for efficient work.

Every adjustment is convenient for the operator and fine for the most accurate work.

Let us have your inquiry.

An Inquiry From South Africa

WE reprint below a letter from M. J. Adam & Co., Johannesburg, S. A. Canadian manufacturers are invited to communicate direct, supplying the desired information.

> *21, 22, Exploration Buildings,*
> *Fox Street,*
> *Johannesburg.*
> *13th September, 1916.*
>
> *The Editor,*
> *The MacLean Publishing Co.,*
> *Toronto, Canada.*
> *Dear Sir,—*
>
> *You are doubtless in touch with Makers of Specialties of interest to Gold and Coal Mines, Railways, Public Works Departments, Municipalities, Builders, etc., etc.*
>
> *Some of your makers may be contemplating appointing Agents in this territory, and as we have been for 20 years in Engineering and Mining Material here, and known to every Mine Official and Buyer, we are in the position to properly represent enterprising Makers, and to advise them as to what this market needs.*
>
> *Probably your Manufacturers are disposed, like some of the British houses, to send goods on consignment, to be paid for as sold, the Agents here giving them the Fidelity Bond. This arrangement works perfectly with us in Belting, Hose, Valves, etc., etc.*
>
> *Kindly send us copies of your* CANADIAN MACHINERY AND MANUFACTURING NEWS, *and put your advertisers in correspondence with us.*
>
> *Awaiting the favor of your reply, we remain,*
> *Yours faithfully,*
> (*Sgd.*) M. J. ADAM & CO.

There is being displayed an ever increasing interest in Canadian Machinery's Export Numbers. Advertisers have been courteous enough to tell us of results secured, while we ourselves have been privileged to forward inquiries from our friends abroad—from Great Britain, Norway, France, Russia, Australia and other countries.

We should like to assure our readers that we shall be glad to answer any and all requests for information regarding lines in which they may be interested. Inquiries are cordially invited, and will be treated in confidence.

Quality **Service**

Courtesy in Business

* * *

Fittingly framed and hanging in the Offices of one of the most important Public Service Corporations on this North American Continent is the following

> 'Did you say Please and Thank you?'

Broad minded men direct the destiny of that Corporation, men who know that public or private enterprises to be lastingly successful must operate for the public good.

Quality and Service are the two important factors in our business life today, but Courtesy is the door through which they must enter.

We are large producers of Hamilton Pig Iron and our output of Open Hearth Steel Blooms and Billets, Iron and Steel Bars of all shapes and size runs into enormous tonnage.

The products of our mills include practically everything that can be manufactured from Iron and Steel and these we distribute to thousands of satisfied customers.

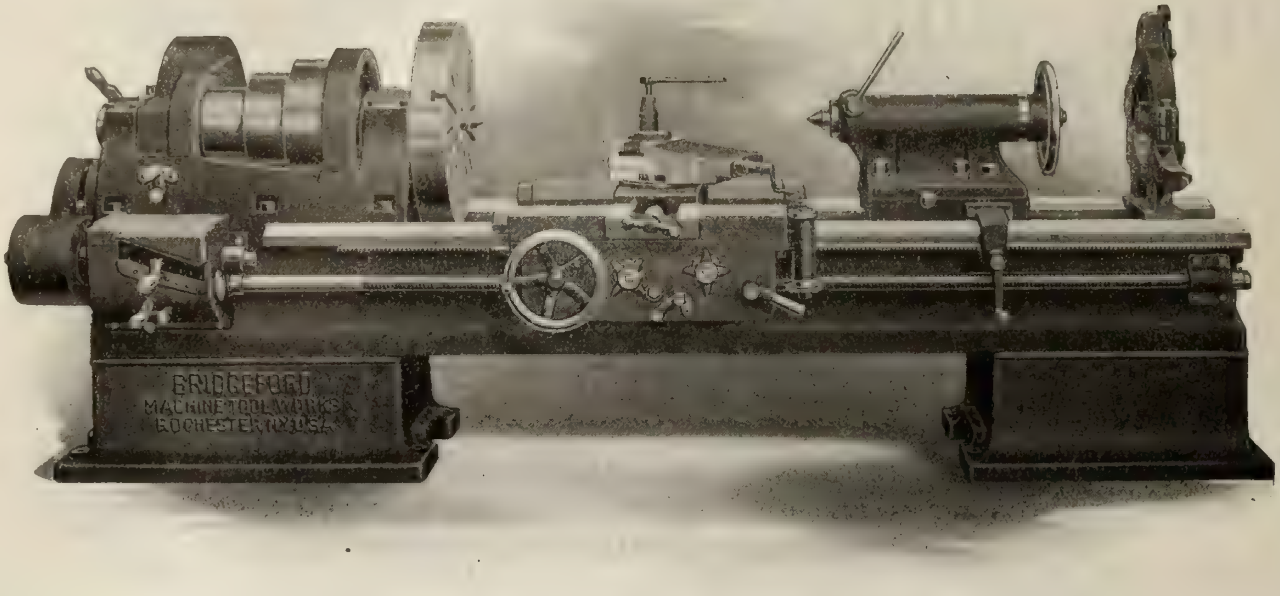
Our business is an extensive one and a successful one. The World is our market: but our prosperity and success in the future, as in the past, depend upon the continued confidence, co-operation and good-will of the people we serve.

The Steel Company of Canada, Limited

HAMILTON TORONTO MONTREAL WINNIPEG

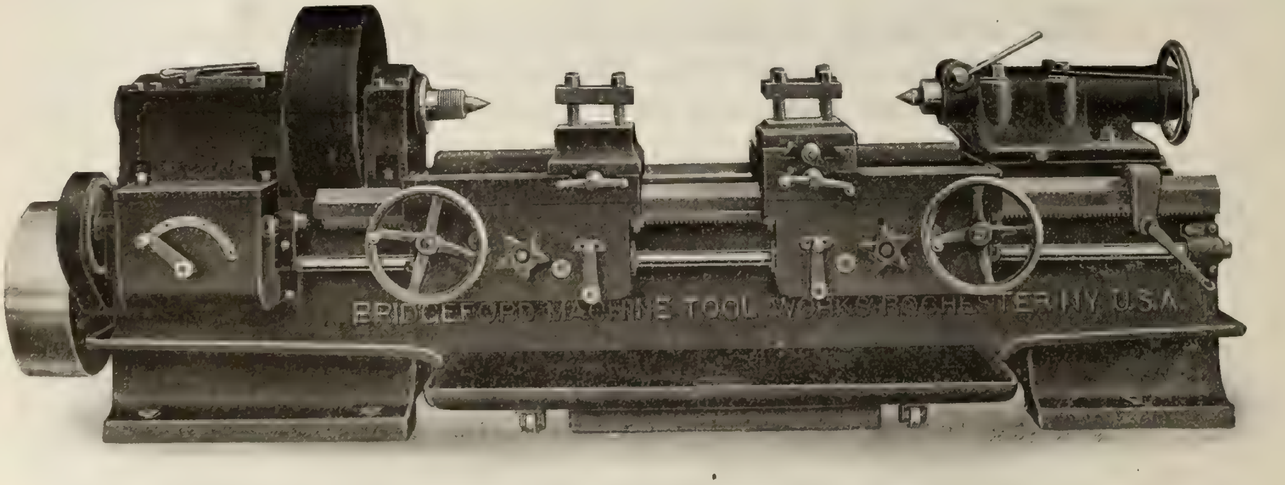
Bridgeford—

for highest efficiency, speed and long life



Bridgeford 26" Cone-driven Lathe, Heavy Pattern.

A powerful, heavy duty, double back-geared lathe with high gear ratio and three-step cone for 5" double belt. Recommended for rough turning 4.5" and 6" shells and for finish turning, band turning and other sundry operations on larger shells.



Bridgeford Heavy Duty Plain Turning Machine.

Also a rapid worker. The powerful drive and convenience of operation insure a maximum output. Very simple. No complicated mechanism. An inexperienced operator can quickly become proficient in the operation of the machine, obtaining maximum results.

For Increased Production "Use a Bridgeford"

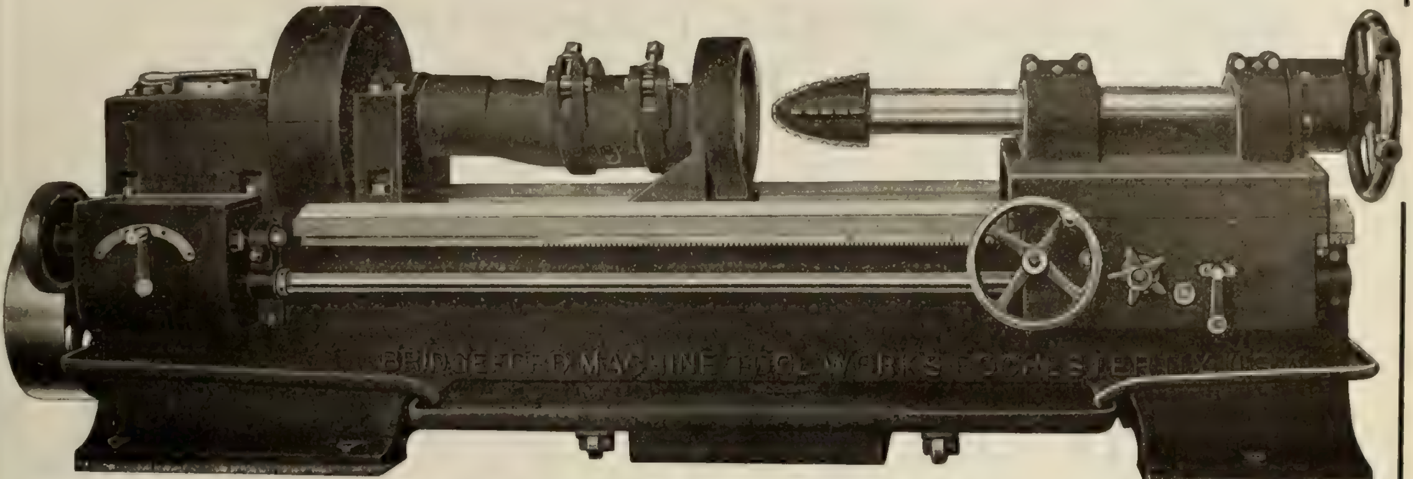
Bridgeford—

for big returns on the investment



BORING LATHE For 8", 9.2 and Larger Shells.

Marvellous for strength, accuracy and production.

A machine of the heavy, low-swing type, having specially designed carriage with auxiliary hand feed for internal profile.

Carries a 5½" steel bar with male taper, allowing for light design of cutter heads; three speed changes—automobile style. All speed gearing is steel, hardened, running in oil bath.

Regular equipment includes water attachment, pump, pan and piping, pot chuck, boring bar and steady rest — everything except cutter heads.

4,000 TON STEAM HYDRAULIC FORGING PRESS FOR MARINE AND OTHER HEAVY FORGINGS.

The product of a modern steam-hydraulic press is denser and more homogeneous than can be obtained with the steam hammer, due to the effect of the blow of the latter not penetrating to the centre, in contradistinction to the uniform kneeding effect of the press; while the amount of work that can be done by the latter at one time with little variation in temperature, strongly tends towards a better product. The greater uniformity and reliability of steam hydraulic forgings make their use imperative wherever high-class products are required.

BASE PLUGS

ACCURACY

Being some account of the Galt Machine Screw Company's Products

"ACCURACY" in the production of such parts as are illustrated opposite, as WE understand the term, means more than uniformity of pitch and body diameter, concentricity of body and thread, contour and finish of heads--it means all this and more—it means CONTINUOUS uniformity, no matter what time may elapse between your orders.

We admit that spasmodic accuracy is possible in ANY plant, but we realized from our advent into business that continuous uniformity was possible only when a complete organization existed, no small part of which would be a splendidly-equipped tool-room, which makes mechanical accuracy constantly possible.

Therefore, only high-grade machine tools were purchased, thus giving us the means of producing the necessary accurate tools from which to make the accurate parts.

With the occupancy of our new factory, our organization has produced better results, so that we are in a position to deliver, in the strictest sense of the term, HIGH-GRADE Cap and Set Screws of all kinds, Semi-Finished and Finished Hexagon Nuts, Studs, Coupling Bolts, etc.,—in fact any first-class automatic screw machine product.

The Galt Machine Screw Co., Limited

It may be that you are contemplating the purchase of a lathe for Shell-making, and it may even be that you are finding it necessary to scrap a lathe which you bought months ago in the confidence that it would do the work required of it, and stand up under the strain. **It would have stood up** had it been a

BAWDEN

Heavy Duty Shell Lathe

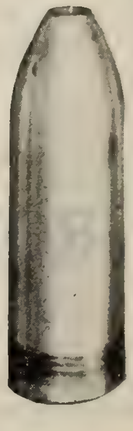
We can say this positively and confidently because many Bawden Lathes installed one and two years ago in munitions plants are doing their work to-day just as satisfactorily as when first installed.

Bawden Lathes are built right—are, rigid, heavy, tremendously strong, and perfectly suited to the work required of them.

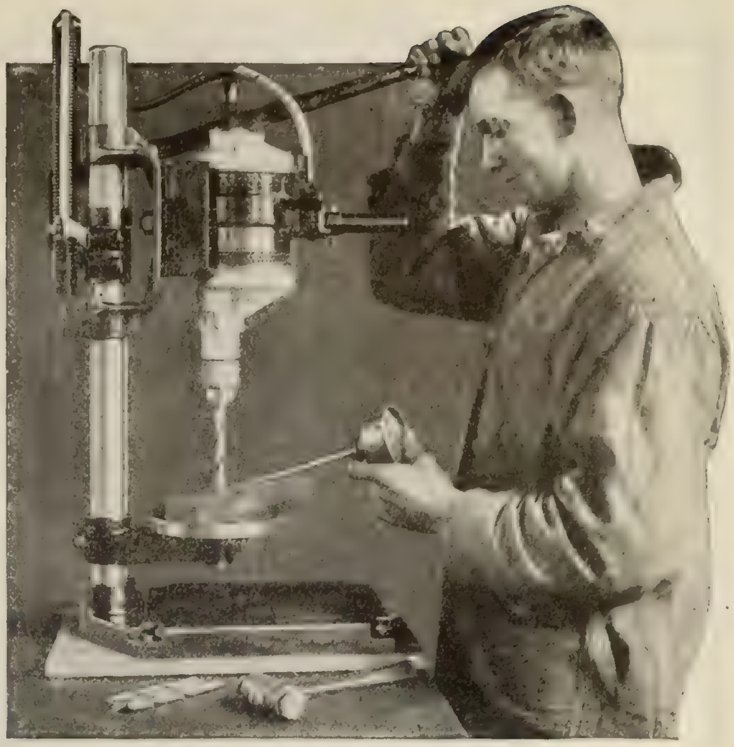
Send for specifications. Also ask for names of factories in which they are in operation.

The Bawden Machine Co., Limited

TORONTO, CANADA



Van Dorn Electric Drills



Van Dorn electrically operated tools are manufactured to meet practically every possible condition of drilling, reaming or grinding.

They are recognized as the most economical machines used to-day in the short run because of their **wonderful speed and efficiency** in operation, and in the long run because of their endurance.

The reason for their superiority is found in twelve years of specialization of the manufacturing, the proof in the universal and growing use of Van Dorn Tools throughout the world.

Van Dorn Electric Tools made light and quick work of the hardest problems, and they soon pay back their initial cost many times over.

If you will write us about your requirements we shall be glad to give you our recommendations and supply you with illustrated catalog.

Malleable Iron.

STANDARDIZED manufacturing processes applied to large output result in lowest costs.

An early recognition of this fact by its manufacturers has given the "Overland" a tremendous lead in volume of sales over other cars in its class.

No machine enjoys floor space in this huge 100-acre plant that does not do its particular work with accuracy and in less time than other machines of its type.

Efficiency is the watchword—the secret of "Overland" success.

"NEW BRITAIN" Multiple-Spindle Automatic Chucking Machines play no small part in the manufacture of the 1,000 "Overlands" produced per day.

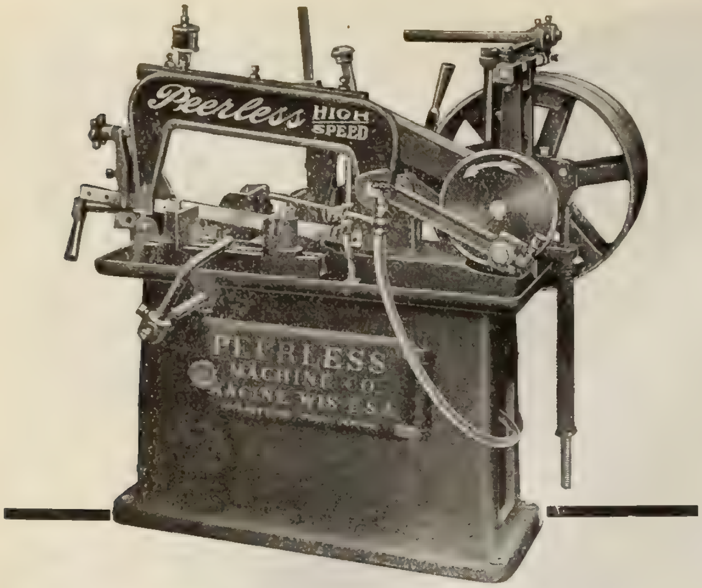
To their already large equipment of these Automatics, new machines are continually being added, handling such parts as Valve Stem Guides, Connecting Rod Bushings, Clutch Yokes, Carburetor Bodies, Fan Pulley Hubs, Push Rod Guides, etc.

If you have similar pieces to chuck, whether castings, forgings, or second-operation screw machine work, it would pay you to investigate the reason for the adoption of "New Britain" Automatics by the large automobile manufacturers.

The NEW BRITAIN MACHINE COMPANY

Automatic Screw and Chucking Machines

NEW BRITAIN, CONNECTICUT, U.S.A.



"100% Better, Faster and More Reliable

than any Sawing Machine we have ever used; we have had almost all makes of Sawing Machines manufactured."

Just what a customer in Toledo, Ohio, reports after a thirty days' trial.

You don't have to take anybody's word for it, try it out under your own conditions. You are under no obligations if it fails—remember we also pay the freight both ways.

Not only 100% more production, but saves 100% floor space. These problems have handicapped many manufacturers for some time. They can now readily be solved by the Peerless High Speed Heavy Duty Metal Cutting Saw.

Write us for complete description and references. Some of these machines may be working in your vicinity.

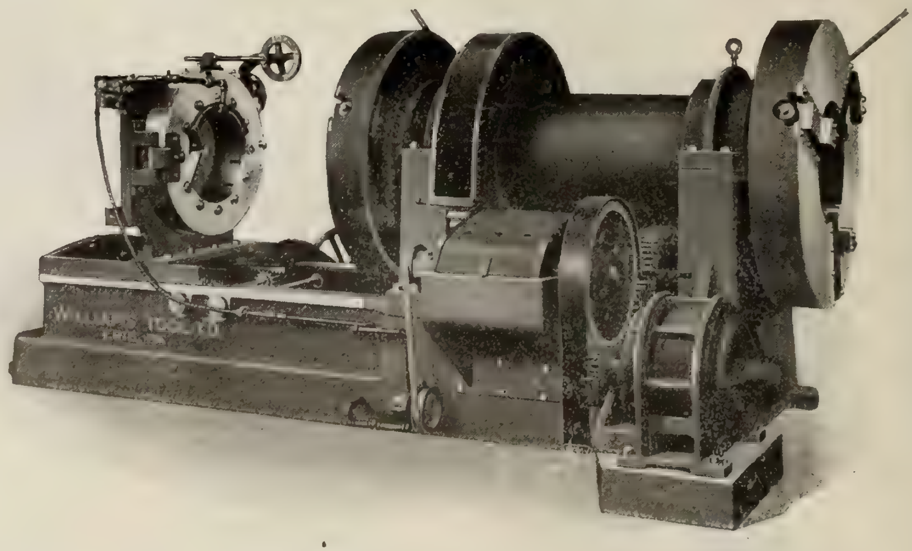
WILLIAMS PIPE MACHINES

Received Highest Award at Panama Exposition



The Following Letter Explains Why:

Williams Tool Co., Erie, Pa.: Rochester, N.Y., 12-3-14.

Gentlemen:—We are so pleased with our No. 3 Pipe Machine, and it is doing such splendid work for us at a minimum of expense that we are now considering the advisability of displacing two smaller machines for one of your No. 1½ or No. 2 motor drive.

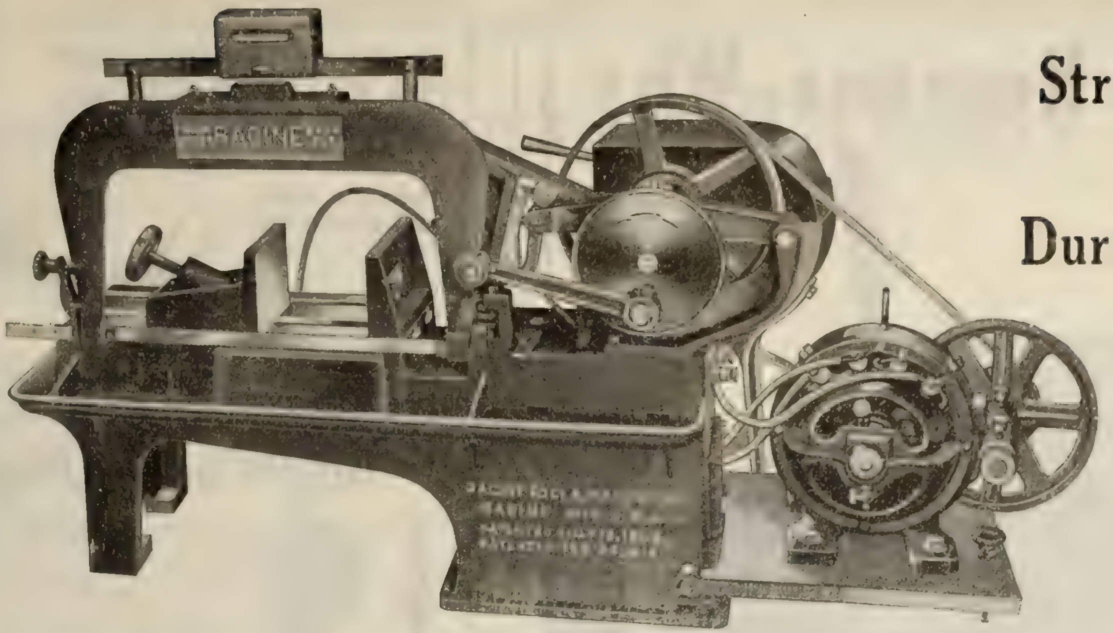
The machines which we would displace, if we make a change, are belt drive, are (names of two of the oldest and best known machines on the market) equipped with nipple holders, extra dies, etc. Both of these machines are still in fairly good condition. On what basis could we make an exchange with you?

Yours very truly, SAMUEL SLOAN & CO.

WILLIAMS TOOL CO. - - - ERIE, PA.

Rapid **Strong**

Massive **Durable**



RACINE

High Speed Metal Cutting Machine

More Speed Less Blades

The "RACINE" is the ORIGINAL, AUTOMATIC, POSITIVE LIFE, DRAW CUT, METAL CUTTING MACHINE—the World's STANDARD in metal cutting.

A machine tool – not a hack saw.

One of the big features of these Racine Metal Cutters is the *Patented Return Stroke Automatic Lifting Device* which lifts the blade clear of the work. It eliminates dragging back on the non-cutting stroke, thereby increasing both the output and endurance of the blade 500 per cent.

This machine is equipped with our Special THREE-SPEED TRANSMISSION, enabling you to cut all kinds of metal at the proper speed—PRACTICALLY THREE MACHINES in ONE.

THE "RACINE" is absolutely positive in every action; it will duplicate itself in every cut during the entire life of the machine.

All bearings are long, heavy and adjustable.

Used extensively in Canadian Plants. One Canadian Steel Company is using 120.

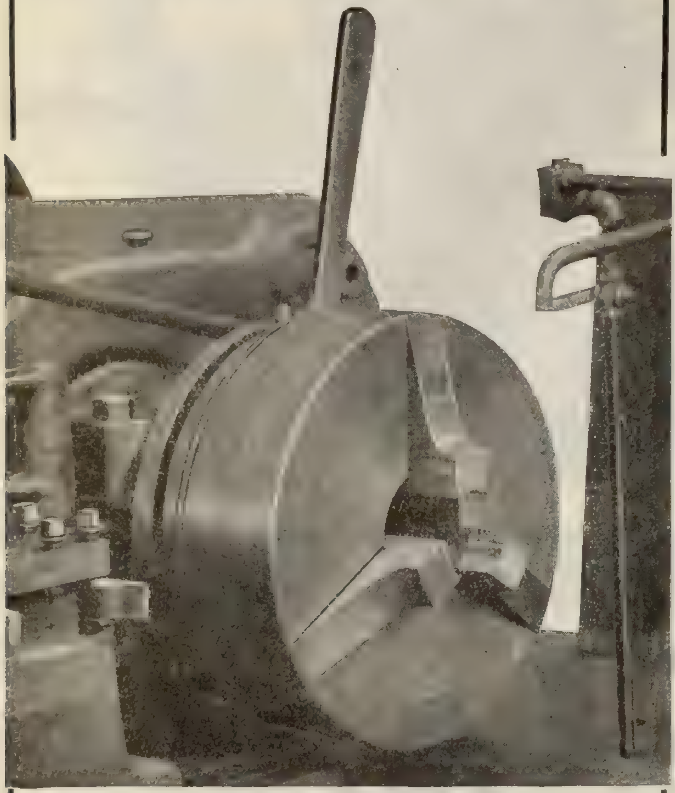
Made in four sizes—6" x 6"; 8" x 8"; 12" x 12" and 12" x 15".

We'll gladly put you in touch with users and send full details.

Racine Tool & Machine Company

15 Melbourne Ave., Racine, Wisconsin, U.S.A.

8 Reasons Why



Barker Wrenchless Chucks

should be on every lathe in your shop—they save time and increase production.

They Are

1. Opened and closed while machine is in motion.
2. A single unit, the operating mechanism and chuck being combined as one.
3. Strong, sturdy and practically trouble-proof.
4. Mounted in the same or less time than ordinary chucks.
5. Wrenchless.
6. Practically frictionless.
7. Costs nothing to install.
8. Overhang $\frac{1}{3}$ less than any air chuck same capacity.

Barker Wrenchless Chucks are not an experiment, but a vast step forward in modern shop practice.

Send for free descriptive literature—no obligation incurred.

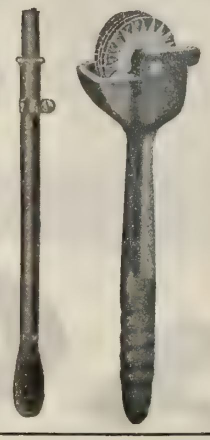
Thomas Elevator Co.
22 So. Hoyne Ave., Chicago, Ill., U. S. A.

IT TAKES MORE TIME TO SHARPEN A TOOL WHEN WHEELS ARE DULL OR COATED—

there's a delay in production too.

Both these losses are offset by the use of

Desmond-Stephan Grinding Wheel Dressers



No matter whether it is the ordinary shop grinding wheel or the largest, coarsest, hardest wheel, we have the tool that will return it to its original cutting efficiency.

Insist upon having your dealer supply you with one of our tools for trial. If he cannot, write us, and we will send any of them on approval.

For the ordinary shop grinding wheel specify the "DIAMO-CARBO."

For large, coarse hard wheels ask for the "SHERMAN-HUNTINGTON."

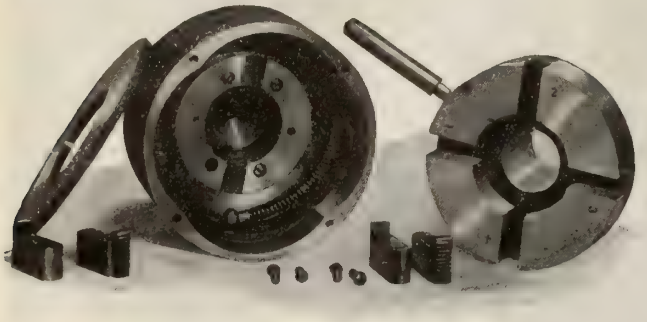
The "IDEAL" Die
for
Shrapnel

Quick, accurate work in threading Fuse Plugs for Shrapnel Shells is essential if you would make maximum profits. Your field is unlimited and your output governs your income. **Why not give the special type "C" Ideal Die a hard trial at this work and see if it will not boost production for you?**

Let the "IDEAL" cut the threads that bind you to low production. They will fit your machines. Circular on request.



"IDEAL" is a *different* die. The head revolves around a stationary cam, thereby utilizing the belt power or cutting strain as opening power. Chasers are supported directly back of cutting strain, which will remove any tendency to bell out and cause taper threads.

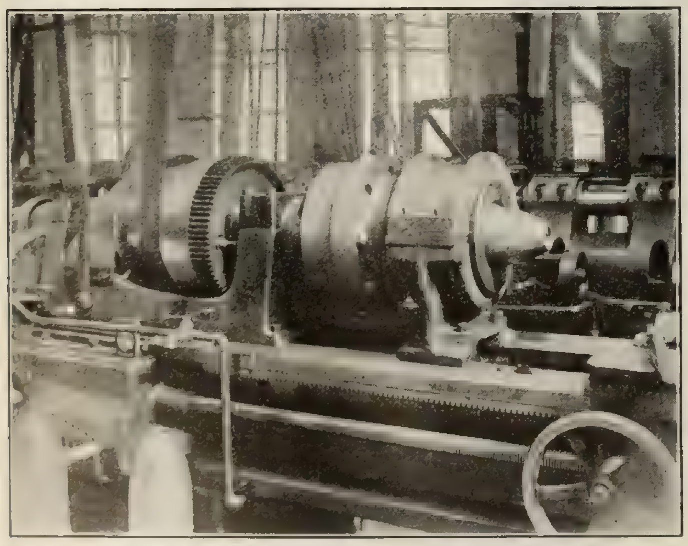
27 William St., MONTREAL



Cut shows Chuck on nosing operation. This is one of over two hundred in this Canadian plant.

This chuck is *built on the duplicate part system. It is simple, effective and fool-proof.*

It grips the shell in a predetermined position. The jaws will not slip on the shell. It has shell interior and exterior adjustable stops.

A trial on one of your lathes will convince you that this is THE Chuck for shell work.

A Big Efficiency Unit in Your Shell Plant

A. J. LAVOIE'S

LOW PRESSURE

Compressed Air Chuck

This chuck can be applied to any make of lathe, without alteration to the machine, and will increase production from 25% to 75%. It grips and releases the shell while in motion—no need to stop your machine.

It is a single unit combination attached to the face plate of lathe, supported by an additional heavy duty bearing, thus making a heavy duty lathe out of a light machine. A small lever operates the chuck. Will operate with a pressure of 60 lbs. per sq. in.

Just Off the Press

To Canadian Manufacturers:

Your copy of this latest catalog on steel lettering dies and stamps is now ready for distribution.

You will find, we believe, that this is the largest and most complete catalog, covering the particular subject, ever distributed in Canada. It embraces steel dies and stamps that can be used in your plant and every plant in Canada irrespective of the nature of the business.

Fully illustrated with half-tone reproductions. Prices shown so that a minimum of time is required to determine cost of your requirements. Handsomely printed and bound and of a standard catalog size for easy filing. Forty-six pages of valuable information. Notice some of the subjects covered:

Partial Contents

Barrel embossing outfits.

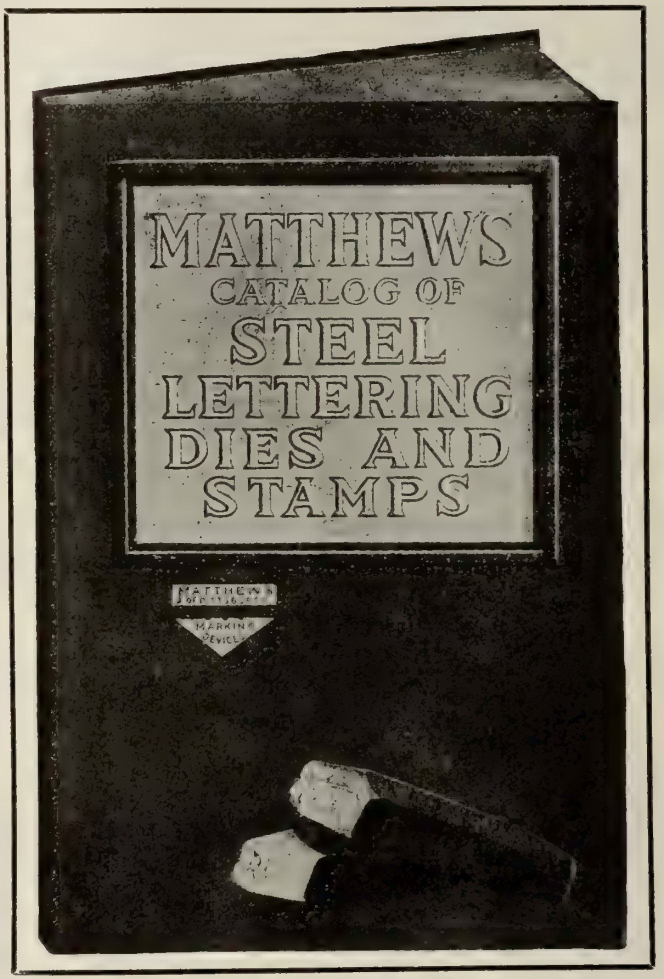
Inspection hammers.

Steel dies for use in presses or special marking machines.

Dies for tin plate.

Machines for embossing tags (metal).

Lumber marking stamps and hammers.



THIS IS THE BOOK

Partial Contents

Steel hand stamps.

Steel letters and figures (hand made).

Symbol stamps for inspection.

Nine different styles of interchangeable hand type holders.

Dies for billet marking.

Steel roller stamps.

Stencil dies.
Embossing dies.

Important Notice: The only catalog ever distributed covering completely all kinds of dies and stamps for shell marking.

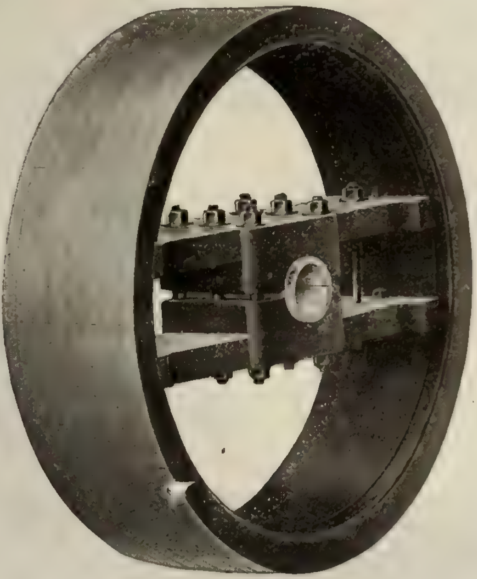
PULLEYS

No Keys

No Set Screws

In Perfect Balance



Lighter

Stronger

Better Belt Surface

The Dodge Standard Wood Split Pulley

The Wood Split Pulley is better than either cast iron split pulleys or steel split pulleys for the following reasons—

The wood pulley is lighter, stronger, better balanced, and provides a very much better belt surface. It costs 33 1-3% less money and provides 50% more returns in horse-power value. It may be run at very much higher speeds with no danger of bursting—also it may be had quicker and in a greater range of sizes.

It costs less to get—less to put on—and less to keep.

We make approximately 300 Dodge pulleys every day—everybody uses them.

There are more Dodge pulleys making ammunition than any other kind—you can get them quick.

Every pulley is thoroughly nailed. Every pulley is guaranteed for Double Belts.

We are Canada's greatest pulley makers.

If you have not our Books, write us.

Gentlemen:-

You will undoubtedly be interested to learn of the service we have derived from the 24" 3-ply Heart Belt we installed January 7th, 1913. This belt drives our entire factory, it has not been taken up since it was placed in operation, and is still giving perfect satisfaction.

Since installing this 24" Heart Belt, we have found it to our advantage to standardize on your Heart Belting throughout our plant. This will indicate more forcibly than words the satisfactory service we have derived from the use of your belting.

Yours very truly,
NICHOLSON-KENDLE FURN. CO.
C. W. Kendle

CWK/EC

"There's no use arguin' agin' a success."
—Josh Billings.

—This bit of homely philosophy explains why the Nicholson-Kendle Furniture Company, and others, standardize on Heart Belting.

—Manufacturers to-day are considering as never before efficiency and economy as applied to plant operation, and a belting must be "a success," must make good before that particular belting is adopted as standard equipment.

—In all industries wherever STRICTLY FIRST QUALITY HEAVY belting is required, Heart Brand is the selection because it is made from the choicest oak tanned leather, tanned in our own tannery slowly, uniformly, and expressly for belting purposes—because it is made carefully, intelligently and honestly—because it is graded to a certain specified standard of quality—because it is "a success."

—You, too, may place full dependence upon Heart Belting, for "There's no use arguin' agin' a success."

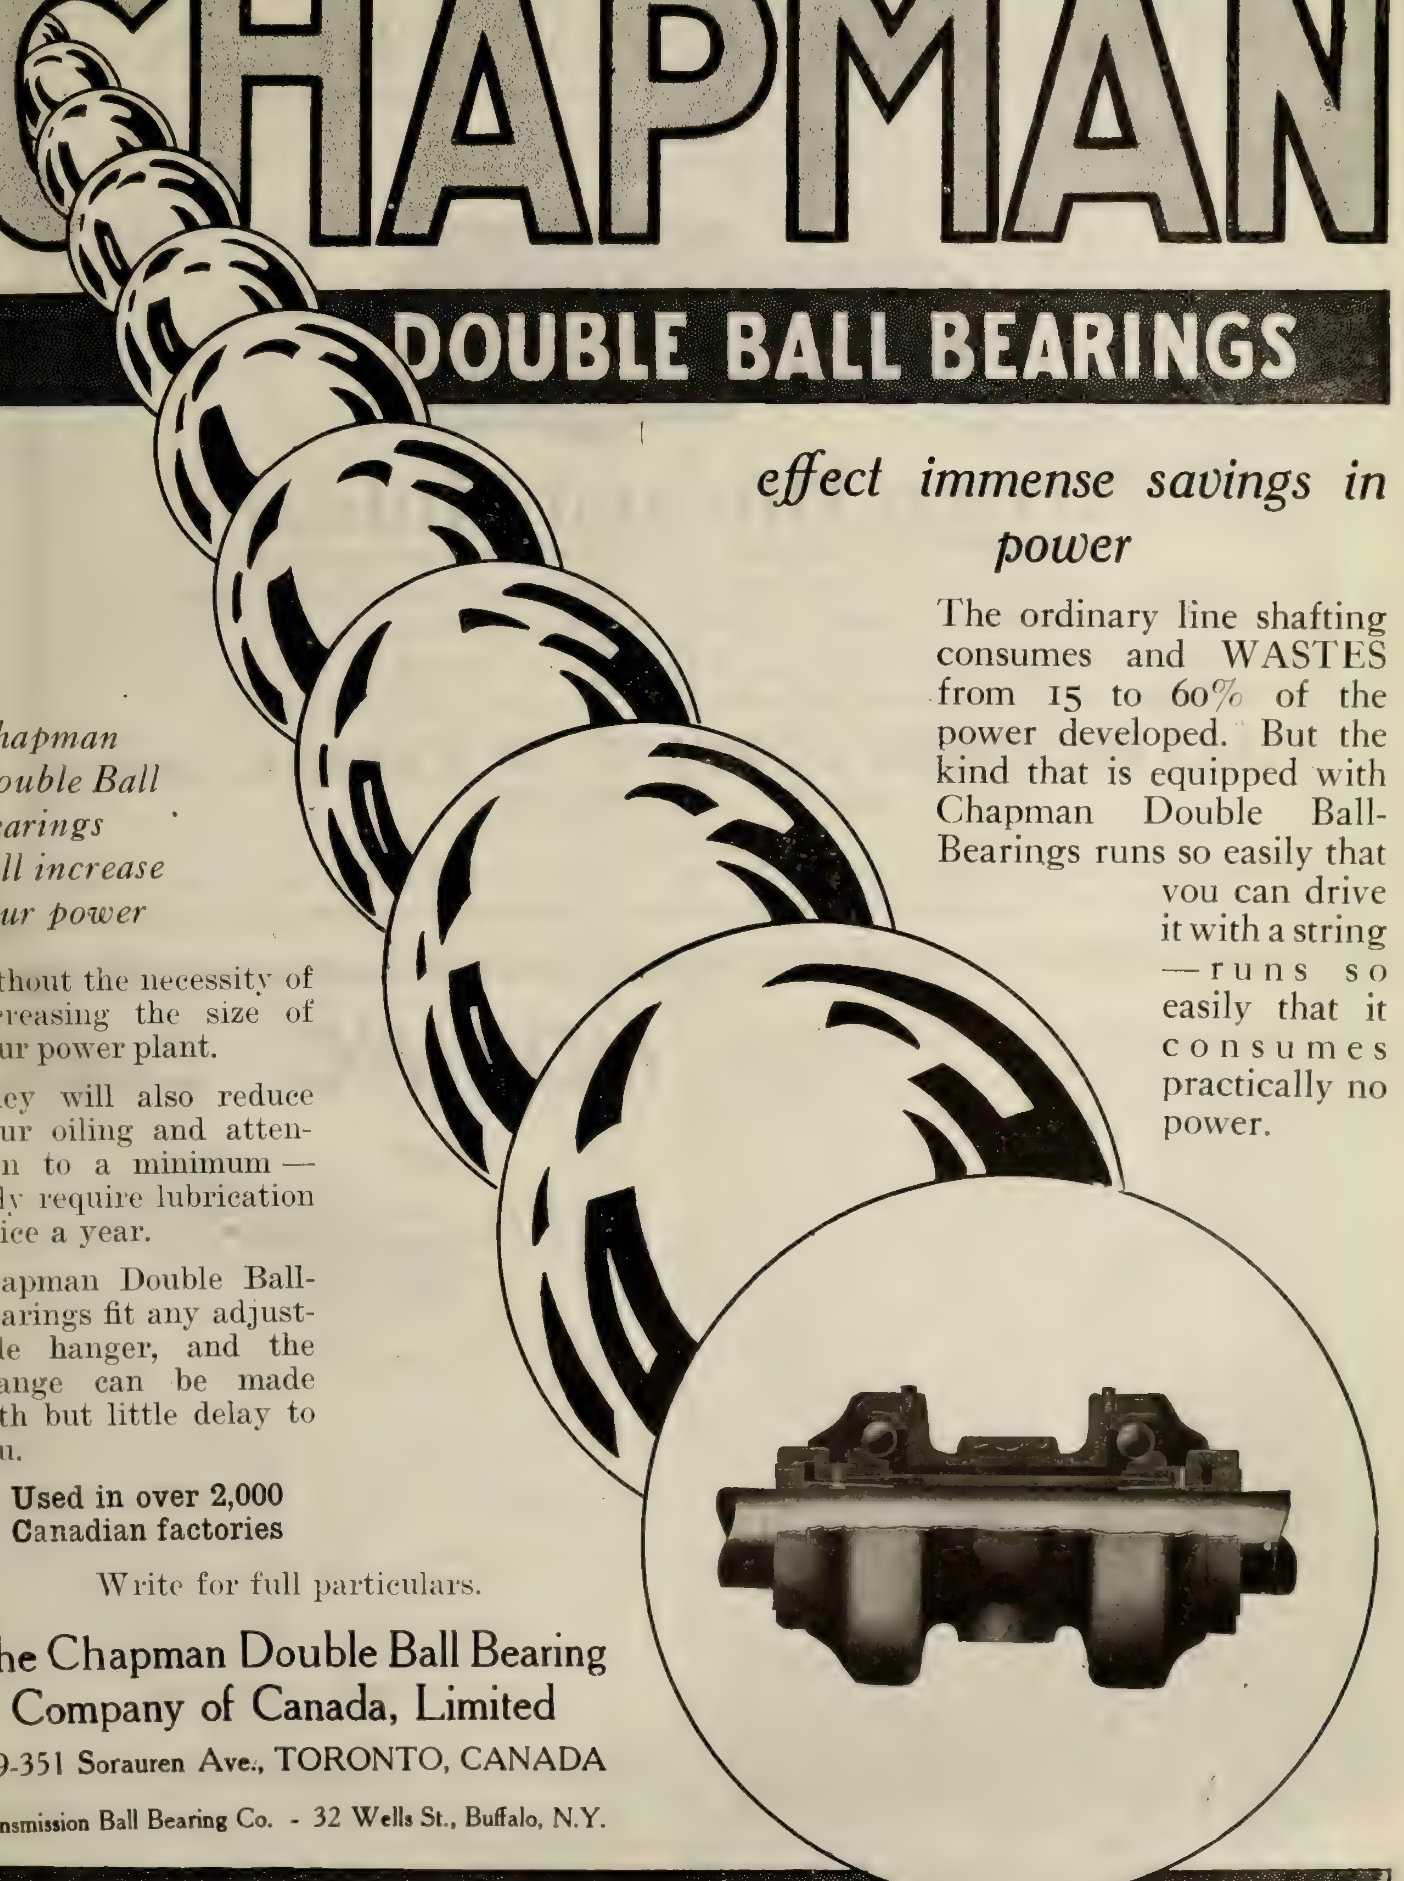
"Consult our Engineering Department in connection with your Transmission Problems."

CHAPMAN

DOUBLE BALL BEARINGS



effect immense savings in power

The ordinary line shafting consumes and WASTES from 15 to 60% of the power developed. But the kind that is equipped with Chapman Double Ball-Bearings runs so easily that you can drive it with a string—runs so easily that it consumes practically no power.

Chapman Double Ball Bearings will increase your power

without the necessity of increasing the size of your power plant.

They will also reduce your oiling and attention to a minimum—only require lubrication twice a year.

Chapman Double Ball-Bearings fit any adjustable hanger, and the change can be made with but little delay to you.

Used in over 2,000 Canadian factories

There's one to every 33rd man

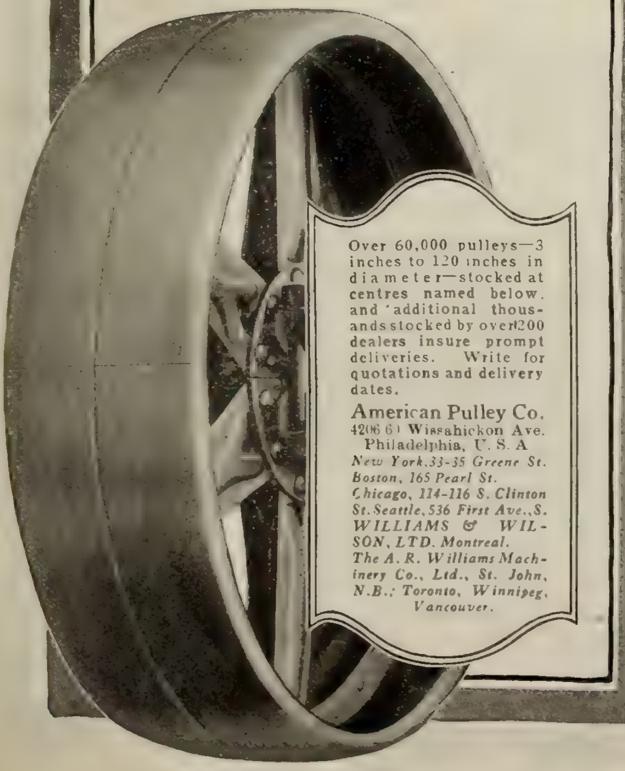
People do not always realize just what it means when we tell them that we have marketed about three million American Steel Split Pulleys.

The significance of these figures lies in the tremendously widespread use of this pulley.

When you compare that part of the population of the country *interested* in steel pulleys, with the total population, it looks like a mighty small factor—but when you consider that this small portion of all the people in the United States has bought so many "AMERICANS" that there is one to every 33rd person in the country, you will get some idea as to the magnitude of this business.

Definite points of merit, definite superiority in service, definite increase in value per dollar—these are some of the reasons why there is one "AMERICAN" Pulley to every 33rd man.

AMERICAN
STEEL SPLIT PULLEY



Over 60,000 pulleys—3 inches to 120 inches in diameter—stocked at centres named below, and additional thousands stocked by over 200 dealers insure prompt deliveries. Write for quotations and delivery dates.

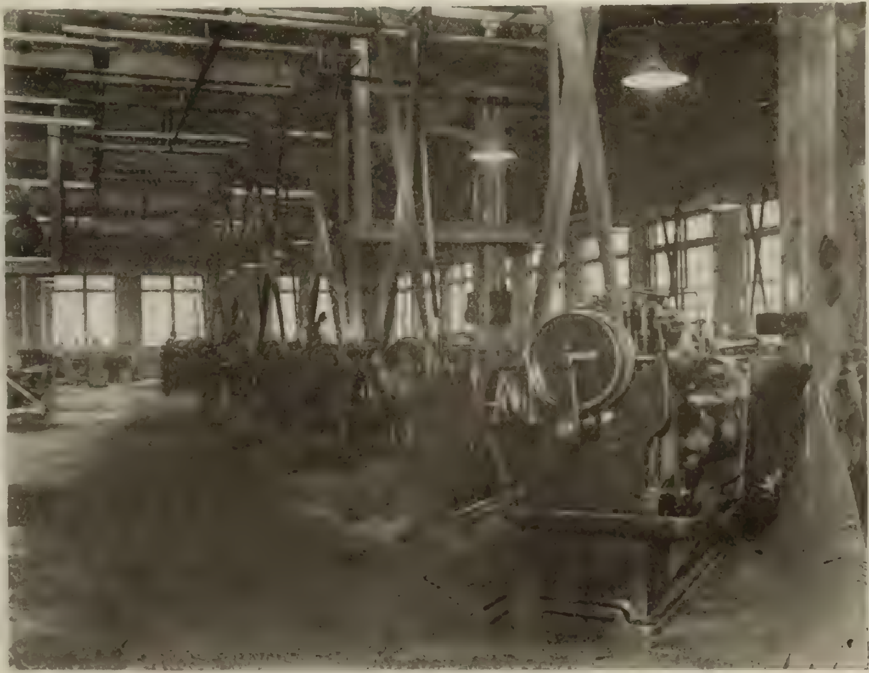
Galt Machine Screw Co.—Its Plant Equipment and Product

Staff Article

Development of our metal-working industries has in the past two years been almost wholly in the direction dictated by the demand for munitions, and instances have been few in which the specific purpose of a plant establishment or extension has been to break into other opportunity offering. The subject matter of this article is, however, an instance of the latter, even notwithstanding the fact that for a time munitions production in line with the scope of the installed equipment was successfully undertaken.

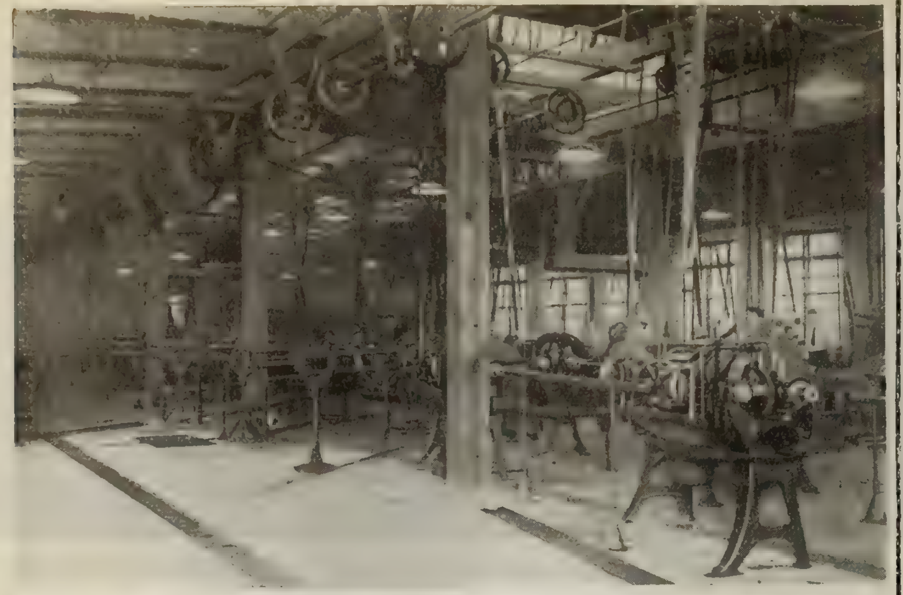
THE Galt Machine Screw Co., started operations in October, 1915, at their new plant located at the north end of Jackson Park, Galt, Ont. Incidentally, we might say, this section of the city is developing into an important manufacturing district. The company was organized by R. W. Roelofson, a prominent citizen of Galt, and was at a later date incorporated. Mr. Roelofson is president and general manager, and C. K. Jansen, secretary-treasurer. At the time of its inception, the demand for the product which the company proposed manufacturing, prompted the belief that there was a wide field for such goods, particularly if the product were of high class manufacture and accurate. A high degree of accuracy has, therefore, been the principal aim of the company, and in the various manufacturing operations this is kept in view. One of the most interesting features from a mechanical standpoint is the installation of automatic machines which take up practically half the floor area in the main shop and are arranged so that they occupy a minimum of room consistent with efficient operation.



Group of four-spindle automatics of the larger sizes, which are used for making all kinds of automatic products from bar stock, as well as heavier sizes of cap and set screws.

Plant Layout.

The factory is of modern design and was constructed and equipped entirely for the purpose of making all kinds of machine screws. It is served by track connections from both the C.P.R. and G.T.R., while cheap power is available from the Ontario Hydro-Electric System. The building is modern in design and is of slow burning mill construction. The walls are brick, with wood columns. The centre bay of the main shop has a saw-tooth roof, providing ample light in addition to that from the windows at the side. The shops and offices are all on the ground floor, with a basement under the main, or machine shop. This shop covers a considerable proportion of the entire plant. At the north end of the factory is a large stock room with commodious offices adjoining, the offices being bright, airy, and well appointed. Adjoining the stock room is the heat treating department, equipped with the most modern apparatus of that nature available. The stock room comprises the raw material storage, finished product storage, shipping room and time-keeper's office, where the employees' entrance is located, and in which is installed an International Time Recorder Co. time clock.



Group of smaller four-spindle automatics with some of the latest types of single spindle automatics in the foreground.

The machine shop content embraces equipment of the most modern type available for the manufacture of the product. At one end of the shop is a well-appointed tool room. In the machine shop are installed several Canadian Crocker-Wheeler electric motors, ranging from 18 h.p. to 50 h.p., which drive the main line shafts. The motors take power from the Ontario Hydro-Electric 550-volt line. The machines are all driven from individual countershafts and are arranged in groups so that certain sections or batteries of machines can be operated by one or more motors, as the case may be.

The health of the employes is a primary consideration in view of its economical advantages. The shops are bright and well ventilated, while bubbling fountains have been installed for drinking purposes. The illumination at night is almost as bright as during the day, being in fact a "daylight factory" all the time. The care of the employes is shown in another way. All cutting oil after being used in the automatic machines is pumped to a tank in the basement and purified by blowing steam through same. The oil is then allowed to settle in other suitable tanks, by which means all metallic particles and other foreign matter are eliminated. This treatment not only improves the lubricating properties of the oil, but it is also rendered antiseptic and will not cause sore places on the operators' hands.

The artificial lighting system, particularly in the machine shop, is most effective and helps in no small degree towards the general efficiency of the plant. Nitrogen-filled lamps of 250 watts are installed in the shops, each lamp having a white enameled reflector. The lighting value in the machine shop is equal to 2½ c.p. per square foot of floor area, an unusually high percentage.

The plant is heated by means of a low pressure steam system. The firebox boiler for this was supplied by the Taylor-Forbes Co., Guelph, Ont., and is located in the basement—the boiler room being of concrete construction and fireproof. The heating pipes are installed along the walls in sections and the system is so arranged that the amount of radiation can be regulated according to the outside temperature. An automatic sprinkler system is also installed.

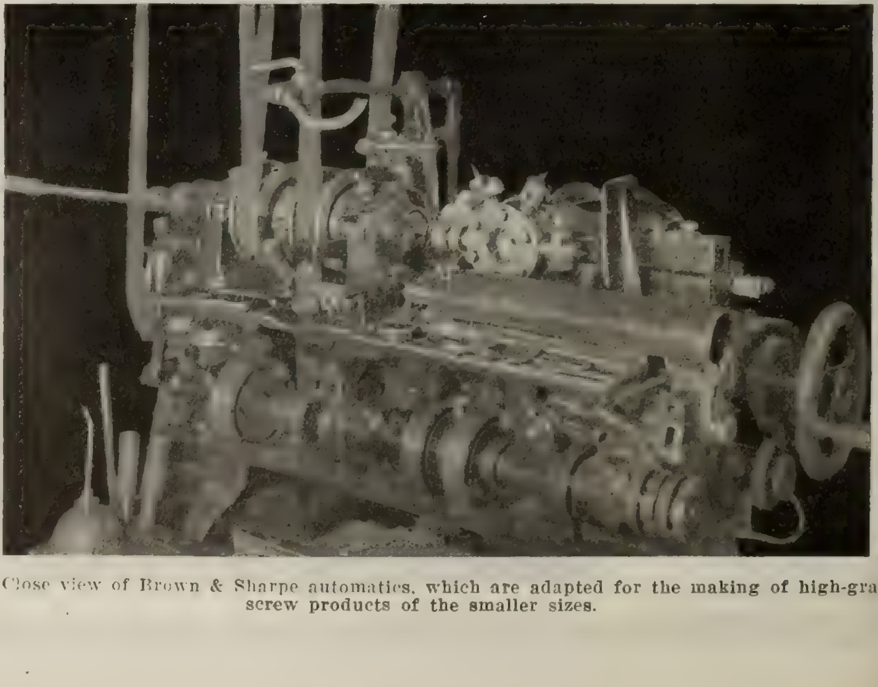
Product.

The company makes a full line of cap and set screws, square and hexagon head, round, flat, filister and button head; taper pins, finished and semi-finished nuts, studs, coupling bolts, patch bolts, washers, etc. The line in fact includes anything that can be produced from bar stock, in steel, brass, copper, or fibre, etc. The range is wide and includes parts that would be used in the construction of anything from a locomotive to a typewriter. The product is used in the construction of machines of various kinds, such as wood and iron working tools, agricultural machinery, sewing machines, typewriters, adding machines, computing scales, washing machines and all manner of automobile parts.

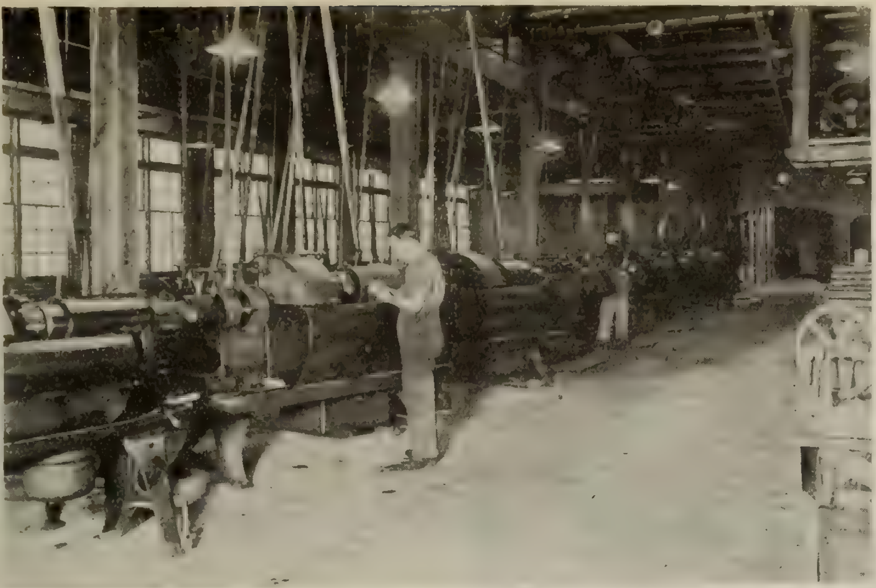
In order to measure up to the high degree of accuracy demanded, great care has to be taken in manufacturing to ensure the desired results. The company make their own tools and fixtures in order to obtain the required accuracy. The "Johansson" system of Swedish gauges is used for all standards other than for threads, and for thread standards the Brown & Sharpe thread micrometer is used for establishing all pitch diameters. All bar stock is unloaded from the cars on the tracks running alonside the factory, and is piled in racks in the stock room. The different grades of bar stock used must conform to physical tests before being shipped from the mills, none but the highest grades of stock being used.

Automatic Machine Installations.

In the manufacture of screws, automatic machines plan an important part, and the plant of the Galt Machine Screw Co. is no exception to the rule, in this regard. The principal equipment therefore consists of eighteen automatic machines of various sizes and capable of producing any size or type of machine screw required. Of this number, thirteen are "Gridley" automatics, built by the Windsor Machine Co., Windsor, Vt., and five are "Cleveland" automatics, built by the Cleveland Automatic Machine Co., Cleveland, Ohio. The installation of "Gridley" automatics includes two 1¾-inch, 4-spindle machines; five 1¼-inch, 4-spindle machines; five ¾-



Close view of Brown & Sharpe automatics, which are adapted for the making of high-grade screw products of the smaller sizes.



Group of single spindle Cleveland type automatics of the larger sizes. These machines are adapted for the production of very accurate work from bar stock in a variety of diameter and length, and applicable alike to typewriters and the very heaviest type of iron-working equipment.

inch, 4-spindle machines and one 2¼-inch, single spindle machine. The installation of "Cleveland" automatics consists of two ⅞-inch to 1¼-inch machines, two 1¼ to 1½-inch machines, and one 2¼-inch machine. The sequence of operations is the same on all machines when producing the same class of work. The extensive line that can be produced on these machines, however, requires a large and varied assortment of tools and fixtures, the application of which differs according to the work to be performed. A detail of manufacture covering each and every product of the company on these machines is not included in the present article. A brief description covering the production of a cap or set screw on a "Gridley" automatic may not be without some interest, however.

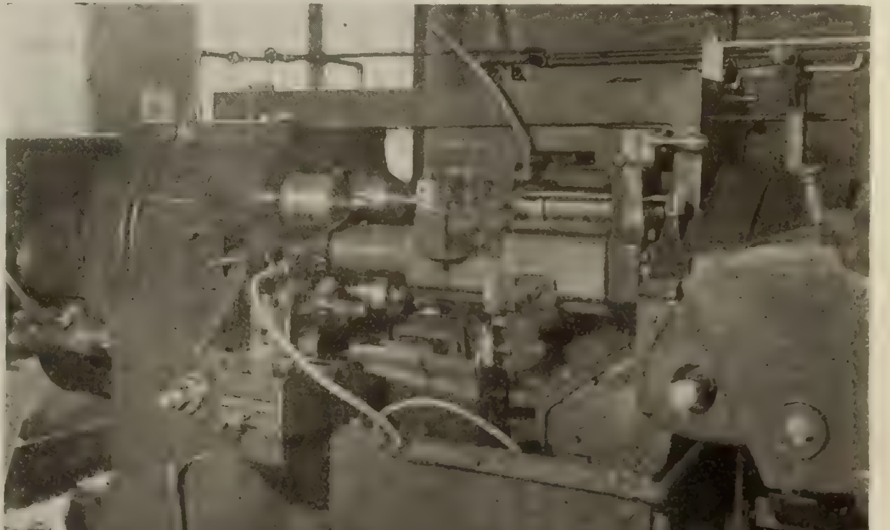
The machine in question holds four bars, and the work is completed at four positions, making one revolution of the rotary spindle. A carrier spindle holds the tooling fixtures, while on the cross slide are two tools, front and back, for forming and cutting off. The bar stock is fed through at the fourth or cutting-off position, and comes up against a stop on the carrier spindle. The machine then indexes to the first position where the first turning operation is performed by a tool on the carrier spindle. While this is being done, a forming tool on the cross slide in front faces up the head of set screw. The machine then indexes to the second position where the finish turning operation is done; at the third position, a die attached to the carrier spindle travels forward and cuts the threads. At the fourth and last position, the cap screw is cut off by a tool on the back of the cross slide. The operation of the machine is practically the same for all classes of work but the tools of course are different.

One of the "Cleveland" automatics installed is a 2¼-inch single spindle machine for heavy work. This machine can take four tools on the turret and has a cross slide for the forming and cutting off tools. Only one length of bar stock is used at one time on this machine. The "Cleveland" single spindle automatic has a turret or carrier which will hold five tools. This machine also has a cross slide with forming and cutting-off tools. When set up for making pins it has one tool and a stop on the tool carrier. In the first position, the bar stock is fed through against the stop, after which the tool turns the pin and the forming tool on front of cross slide forms the head. The last operation, or cutting off, is performed by the tool on back of the cross slide. This machine, of course, is capable of producing a large variety of work and is tooled up accordingly.

Secondary Operations.

In the manufacture of the screws and pins, etc., the primary operations are performed on the automatic machines. There is still, however, more work to be done on them before they are finished, such as slots to be made and burrs removed, and, in some cases, holes drilled. These secondary or finishing operations are performed on a number of machines installed for the purpose, and include those for facing, grinding, polishing, burring, milling, and drilling. For performing the secondary operations the following equipment is installed, there being also included tools of minor importance for making bolts, etc. Some of these tools have also been used in making primers in which case they had special attachments designed for the purpose. Drill presses were supplied by Henry & Wright, Hartford, Conn.; Cincinnati Pulley Machine Co., Cincinnati, Ohio; The Sipp Machine Co., Paterson, N.J., and the Perfect Machine Co., Galt, Ont.; a tapper by the Garvin Machine Co., New York; nut threading machine by the National Machinery Co., Tiffin, Ohio; stud machine by the Foster Machine Co., Elkhart, Ind.; small screw machine by Pratt & Whitney, Hartford, Conn.; stud machine by the T. M. Smith Machine Co., Grand Rapids, Mich. There is also a "Sterling" hack saw machine and a centrifugal oil extractor.

One machine of particular interest was designed by the Galt Machine Screw Co. for facing stud and bolt heads. This machine has five spindles in a row, each having a collet chuck for holding the studs. In front of the machine are five rocking arms, one in front of each chuck, each holding a tool for facing the stud



A close view of one of the heavy four-spindle automatic machines with the oil guard removed to show system of tooling. These machines are used for the production of all kinds of standard cap and set screw work, as well as a multiplicity of other automatic products, four bars being worked on simultaneously.

Illustrating one of the Steel Storage Racks.

head. The arms are operated by cams on the back of the machine and work in succession, permitting the operator to remove each stud when finished without stopping the machine.

Tool Room.

The tool room is an important feature of the plant, as the desired accuracy can only be obtained by using properly designed and accurate tools. The company make practically all their own tools and fixtures in order to ensure the high degree of accuracy required in the manufacture of their product. The machinery installed in tool room consists of a Brown & Sharpe miller, and "Excelsior" 20-inch drill press; a Cincinnati Universal grinder; a tool room lathe by R. McDougall, Galt; a Blake & Johnston drill press, and a Stewart gas furnace supplied by the Chicago Flexible Shaft Co., Chicago.

The heat treating plant adjoining the stock room is well equipped and modern in every respect. The principal equipment installed consists of Rockwell, and Tate-Jones furnaces, using natural gas. The electric hydrometers installed are of "Tycos" make.

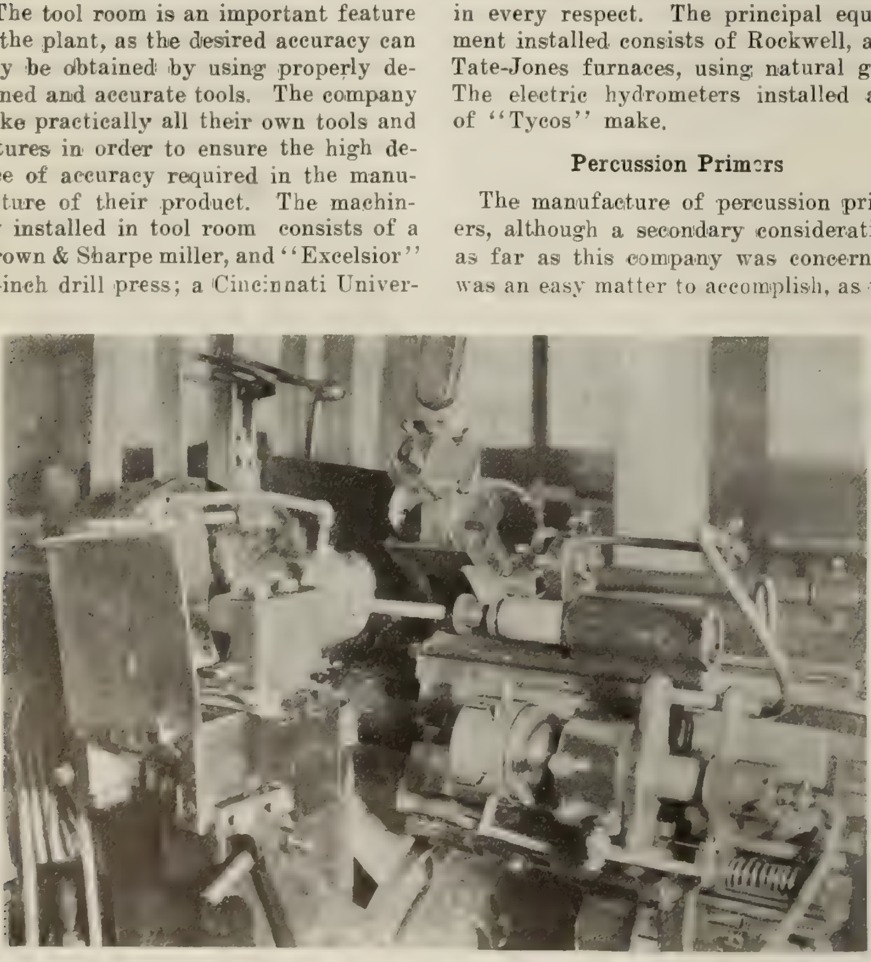
Percussion Primers

The manufacture of percussion primers, although a secondary consideration as far as this company was concerned, was an easy matter to accomplish, as the greater part of the equipment required for such work was already installed. They have completed a large order, and are now confining their energies entirely to the production of their regular product, viz., machine screws.

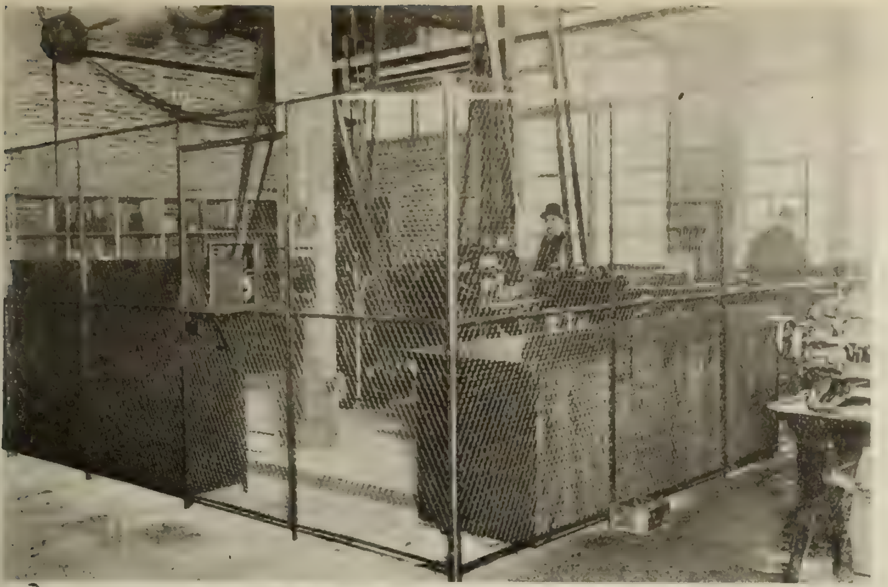
The primer comprises six parts—the body, anvil, plug, disc, copper ball and percussion cap. The body is made from 1 7-16 in. round brass bar stock, the first series of operations being performed on a Gridley 1¾ inch multiple spindle automatic machine. The other parts are also made of brass, with the exception of the copper ball. The initial operations on the automatic machines are performed in the following order:

The first operation consists of forming the outside and rough drilling the inside, the forming tool being on the front of the cross slide and the drill on the spindle tool carrier. At the second position the outside is finished by a tool on the carrier, while at the third position the external diameter is threaded. At the fourth operation the inside bore is finished by a reamer on tool carrier, and the cutting-off tool on the back cross slide finishes the work on the automatics. After cutting off, the bar stock is fed forward for the next primer.

On the Cleveland automatic single spindle machines, the sequence of operations is practically the same. The bar stock is fed through to a stop on the tool carrier. The carrier then moves round to the next position, and a combination fixture rough turns the outside diameter and drills the inside. At the third position a similar fixture finishes the body, both inside and outside. At the fourth operation the outside thread is cut by a die on the tool carrier. The cutting-off tool is on the front of the cross slide. After leaving the automatic machine, the primers are washed and inspected. The ends are then faced on a Pratt & Whitney hand screw machine. The next operation consists of milling the key slots in the base in a Brown & Sharpe hand milling machine, which is equipped with a special indexing fixture. The following operation is reaming the tap hole and the smaller hole in the base on a Henry & Wright two-spindle drilling machine carrying a combination reamer. The small hole is then tapped in a Garvin tapping machine. The percussion cap hole is next finish reamed. This is done on a Sipp drill, using special fixtures. The next operation is hand chasing the outside threads, after which the base is stamped and the primer washed in a solution to remove the grease. It is then inspected and placed in an electric oven at a temperature of 160 degrees for about 15 minutes, after which follows the lacquering process. At this stage there is another careful inspection.



Close view of one of the heavy types of automatic turret lathe. These machines are capable of producing highest grade heavy work with extremely fine limits of tolerance, and lend themselves to the production of automatic parts which would be difficult to produce on machines less rigidly built.



Tool room equipped with the most modern appliances for the production of high-grade and accurate tools required by the various machines.

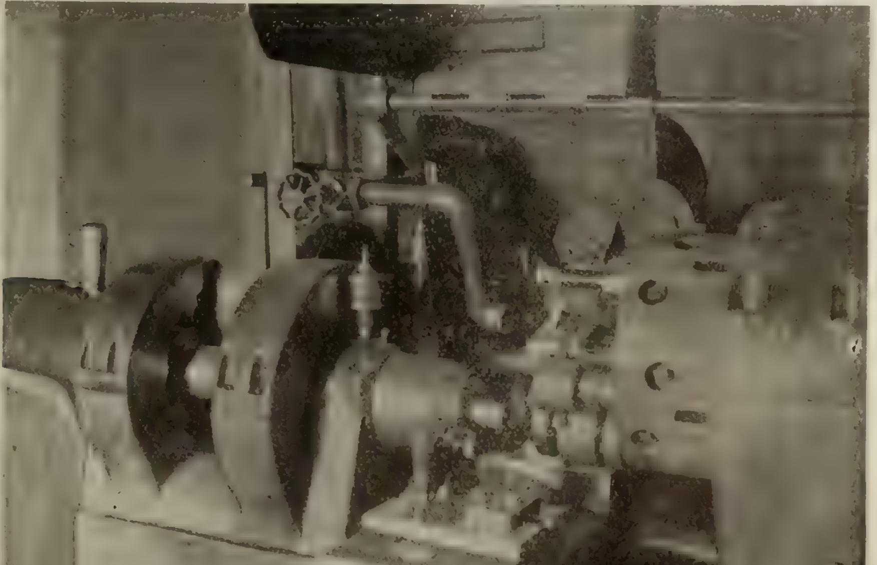
Anvils

The anvil is made from 3/8 in. round brass bar stock, most of the operations being performed on a Brown & Sharpe automatic screw machine. The sequence is as follows:—First operation stock is fed to a stop. The second tool on turret bores the hole, while a forming tool on front of cross slide forms the dome on the anvil. The outside threads are then cut, after which the cutting-off tool parts the anvil from the rod. A clever device is attached to the machine, which lifts the anvil after being cut off and holds it while the burrs are being removed.

The next operation on the anvil is slotting, which is done on a Pratt & Whitney screw machine fitted with a special fixture made at the plant. The anvil is held in a collet chuck, while a rotary cutter forms the slot. The machine is fitted with a device working on a trip for tightening the anvil, and also ejecting it when the operation is completed. The fire holes, three in number, are drilled in a Cincinnati Pulley Machinery Co. drill press, equipped with a special indexing fixture, also designed at the plant.

Plugs

The plug is made on a Brown & Sharpe automatic screw machine from 3/8 in. round brass stock, the order of operations being as follows:—Feed bar to stop, then form and cut the groove. The thread is then cut and the plug cut off. This machine also has a burring attachment. The fire holes in the plug are drilled in the same machine as the anvils, but a different fixture is used. In the anvil the holes are drilled at an angle, whereas in the plug they are parallel.



Close view of one of Cleveland type automatic machines. The tooling illustrated was for the production of primers, one of which is shown in the chuck, finished ready to cut off.

Discs

The closing discs are punched out from a brass strip on a Brown, Boggs Co. press. They are then cupped on a Pratt & Whitney screw machine, during which operation the disc is held in a special chuck with the cupping tool in the turret. After being cupped, the discs are annealed, then slit and closed back on Brown, Boggs punch presses. The discs are next inspected. The percussion cap is made of brass in a small punch press, a combination blanking and cupping punch and die being used. The ball is made of soft copper, and is purchased outside.

Inspection forms an important feature in the manufacture of primers, as a high standard of workmanship and accuracy is required. It is, therefore, necessary, in order to check any possible errors during the various operations, that the various parts should be inspected at different stages of manufacture. The final inspection is very rigid, and is conducted in a department set apart for that purpose. Although the majority of the machine tools installed are of standard type, practically all the tooling fixtures and special jugs were designed and made on the plant. It is in this feature perhaps that the chief interest lies and contributed largely to the success attained by the product of this plant.

CANADA'S FIRE LOSS A NATIONAL HANDICAP

IT is perhaps not fully realized by all the advocates of foreign trade expansion that Canada, by reason of the enormous proportions of her fire loss, will find it increasingly difficult to meet the competition of lower-priced labor in Europe. A contributor to *Conservation* for October, calls attention to the excessive cost of fire protection in this country and the manner in which it is bound to retard that future development now so hopefully looked forward to:—

The fire loss of Canada has reached enormous proportions. The drain upon her financial resources constitutes an economic loss which no country can afford and still meet competing nations on an equal footing. The war has had far-reaching effects upon commerce. European countries, in greater or less degree, are realizing their latent powers, production is being speeded up, resources are being developed, trade openings are being sought and established. Prior to the war, Canada found herself handicapped in any scheme of trade expansion by the lower cost of production in Europe. It therefore follows that, with the realization by European countries of their commercial possibilities, this trade handicap will be greatly accentuated.

On the basis of averages, and from the data available as to the cost of insurance and upkeep of fire departments, the following comparisons may be deduced:—

For the past three years the average rate for fire insurance in Canada has been $1.18 per $100 of insurance. The average rate in Sweden is .40, in Austria .30, in England .23, in Germany .22, in France .21, in Spain .19, in Italy .19.

A Canadian employer of labor with 100 employes, carrying an insurance of $50,000 on plant and buildings, and, assuming that $2,000 insurance is carried or paid for by each employee on furniture and dwelling—or a total of $250,000—would, on the foregoing basis, have to provide in wages and overhead charges $2,950. His competitor in Sweden would only require $1,000, in Austria $750, in England $575, in Germany $550, in France $525, in Spain and Italy $475.

For upkeep of fire departments Canada is heavily taxed in comparison with competing countries. In 1914, Paris, France, with a population of 2,846,986, had a total fire department expenditure of approximately $656,479, or 23 cents per head. Toronto, for the same year, with a population of 470,144,, spent $675,146 on her fire department, equal to $1.43 per head.

The Toronto manufacturer—and this is only an example for all Canada—has to provide for himself and family and for each employee and his family $1.43 to cover fire department costs, as against the 23 cents his Paris competitor must provide; or, with an average of five to a family, for his 100 employees, he would have to pay in salaries and wages $722.15 as against $116.15 by his European competitor. For insurance and upkeep of fire department the Toronto employer of 100 hands, as representative of Canadian industry, must pay $3,672 against $641 in Paris, a handicap equal to $30 per employee.

The Census Report of 1911 gives 515,203 as the number of employees engaged in manufacturing in Canada; consequently at $30 per head, there is a handicap of $15,456,090 against Canadian manufacturers in the cost of fire insurance and municipal fire departments. The salaries and wages paid to these 515,203 employees amounted to $241,008.416. an average of $467.80, or approximately $9.00 per week. The foregoing handicap of $30 per employee represents the wages for 3.3 weeks of each employee.

In 1910 the products of Canadian manufacturers were valued at $1,165,975,639. This charge for insurance and municipal fire protection therefore represents an added tax of 1.3 per cent. upon Canada's entire output of manufactures. The fact that much the larger portion of this amount is buried in the pay-roll can be accepted as the reason why our employers have given so little attention to the question. The charge must be met, however, whether by direct or indirect means.

Employers complain of the rising cost of manufacturing; employees complain of the rising cost of living and demand increased wages. In view of the foregoing, employers should seriously consider reduction of the burden imposed by the enormous destruction of our created resources by fire—that their earnings may not be reduced by these charges and thus remove one of our heavy handicaps before Canadian employers and employees meet world competition under the new trade conditions which will develop after the war.

*

DEATH OF CAPT. F. R. NEWMAN

THE death of Captain Frank Ross Newman in London, England, on October 23, as a result of wounds received in action, will be received with regret by a wide circle of friends. Capt. Newman was wounded on Sept. 28th on the Somme front and was progressing favorably, until tetanus supervened, resulting in his death. He had previously been invalided to England suffering from trench fever, but recovered, and was able to return to duty. Capt. Newman was born in Montreal in 1879, and was educated in that city, graduating from McGill University.

THE LATE CAPTAIN FRANK ROSS NEWMAN.

He started his business career with Caverhill, Learmont & Co., wholesale hardware, Montreal, his father, Thomas H. Newman, now deceased, being a partner in the concern. In course of time he left this firm, and went to Winnipeg to open a branch office for the Canadian Fairbanks Co., being appointed manager. He eventually resigned this position and joined the staff of the Laurentide Paper Co., at Grand Mere, Que. In 1911 he returned to the Canadian Fairbanks-Morse Co. as manager of the Toronto sales office, which position he held until the autumn of 1914, when he resigned upon being appointed to a captaincy in the 19th Battalion, C.E.F.

Soon after coming to Toronto in 1911, Capt. Newman joined the Queen's Own Rifles as a lieutenant, and was an officer in that regiment until his appointment as captain and quartermaster of the 19th Battalion, which went overseas in the spring of 1915.

The deceased was unmarried, and is survived by his mother, who lives in Montreal, and also by two brothers, Capt. Harry Newman, of the 5th Royal Highlanders, and John Newman, manager of the Montreal branch of the McClary Mfg. Co. His only sister married Capt. Gurd, Canadian A.M.C., who is now on active service. His mother sailed for England just before the arrival of the cablegram announcing her son's death.

Capt. Newman was as keen and efficient as an officer as he was in business. His kind and genial disposition endeared him to all with whom he came in contact. He was a man of peace, but died loyally serving his country. The remains will be sent to Montreal and accorded a military funeral.

*

B. C. LUMBER OUTPUT

THE timber returns for August, issued by the Forest Branch, show the total scale of saw-logs for the province to be 107,843,857 feet B.M., in addition to 257,589 lineal feet of poles and piles, and 26,635 cords of shingle bolts, posts etc.

The returns according to forest districts are as follows:—Vancouver, 73,313,384 feet saw-logs, 62,430 lineal feet poles, etc., and 3,215 cords of bolts, ties, etc.; Cranbrook, 12,855,604 feet sawlogs, 20,330 lineal feet poles, etc., and 7,715 cords of posts, bolts, etc.; Island, 12,411,953 feet sawlogs and 209 cords bolts, ties, etc.; Prince Rupert, 4,378,017 feet sawlogs, 47,083 lineal feet poles and piles, and 60 cords of bolts, posts, etc.; Kamloops, 2,920,687 feet sawlogs, 114,582 lineal feet poles, etc., and 3,215 cords of posts, bolts, etc.; Vernon, 177,157 feet sawlogs; Hazelton, 83,184 feet sawlogs; Lillooet, 9,538 feet sawlogs and 11,282 lineal feet poles and piling; Fort George, 8,344 feet sawlogs, 1,882 feet poles and piles, and 100 cords of posts, etc.

Timber sales made during the month of August cover an estimated total of 21,844,000 feet sawlogs, 13,250 lineal feet poles and piling, and 498 cords of shingle bolts, posts and cordwood, to produce an estimated revenue of $34,929.

PRODUCTION METHODS AND DEVICES

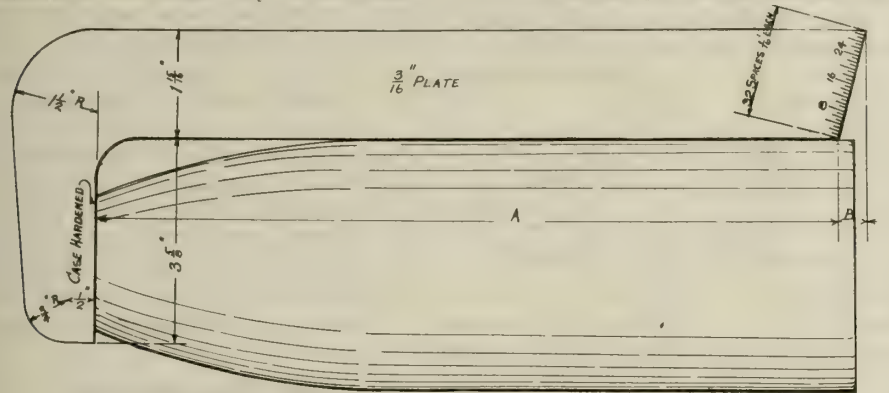
WEIGHT ADJUSTING GAUGE FOR SHELLS

By John S. Watts.

THE sketch shows a gauge used for indicating the maximum amount of weight that may be machined from the base of a shell without reducing its length below the minimum.

To use the gauge, the shell is first weighed in the usual way to determine the number of ounces it is overweight. Then the gauge is placed on the shell and a scale laid across the base will indicate the ounces which may be removed and still not get the shell short for length. If the overweight, as shown by the weighing, is, say, 10 ounces, and the gauge indicates that only 8 ounces can be removed from the base, we mark 8 on the shell as the number of ounces to be faced off the base end, and the other two ounces are removed later from the inside of the shell.



GAUGE FORADJUSTING WEIGHT OF SHELLS.

On the other hand, if the gauge showed, say, 12 ounces as removable from the base, we mark 10 on the shell and face off the whole 10 ounces from the base.

To make the gauge, the length A is made to the minimum length of the shell, plus about 1-64 in. for tracing up the base after riveting in the base plug. The length B of the gauge is made equal to that length of the shell which will weigh 32 ounces (or such other amount as may be preferred), and the slanting end is divided into 32 equal divisions, each of which will then represent a weight of one ounce in the length of the shell over the minimum length and hence removable if necessary.

The idea of making the divisions on the slant is to have them sufficiently far apart to be easily readable.

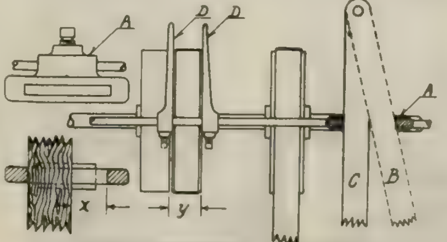
BELT SHIFTER TROUBLE

By J. H. R.

MACHINE operators are often annoyed by the gradual starting or stopping of their machines, due to the creep of the belt from one position to another. This may be caused by faulty belting or shafting out of alignment. However, in many instances the trouble originates through the action of the shifter, especially where the wooden stick makes a great angle with the perpendicular, the weight being sufficient to overcome the friction of the various joints; thus the heavy stick seeks to return to a vertical position, with the result that the belt is forced over to the adjacent pulley. In an effort to remedy this trouble, a foreman in a small shop adopted the method shown in the sketch, where the belt shifter stick remains in a vertical position, after the machine has been started or stopped. Instead of the stick being pivoted to the shifter rod, it is allowed to swing freely in a slotted bracket A, which is fastened to the rod upon which the shifting forks D-D are secured. When hanging free, the stick is always perpendicular as shown at C; the position B (to the right or left) being so after shifting the belt. After the belt has been shifted, the stick will return to a vertical position, so that whether you are starting or stopping the machine, the belt stick will always be in the same position. The length of the slot will equal the width of the stick plus the distance (x); the latter being equal to the space (y), or the side movement of the belt in its passage from one pulley to the other.



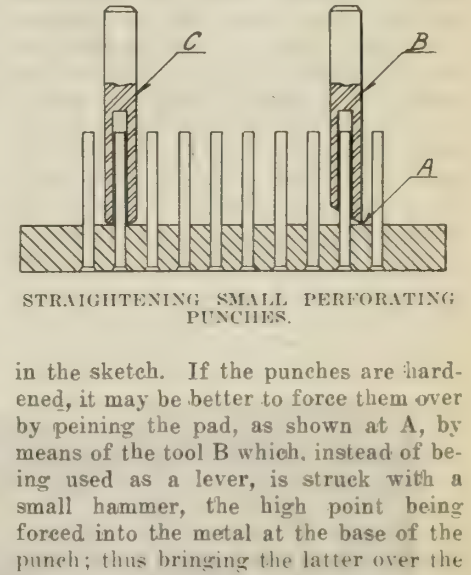
BELT SHIFTER TROUBLE.

STRAIGHTENING SMALL PERFORATING PUNCHES

By J. Hamilton.

WHEN making perforating dies for light sheet metal, it is often found that several of the punches will incline a little from the perpendicular, owing to a slight bend in the wire or to the drill having run when drilling the punch pad. In order that the punches will enter the die or allow the stripper to slide freely, they must be at right angles to the pad surface; it is, therefore, necessary that bent or inclined punches should be straightened. Where the fault is in the punches themselves, they can be replaced by new ones, but where the cause is in the pad, the pin must be bent to straighten it up. If the punches are soft, they can be easily bent, but care must be taken to have the bend come close to the pad.

A very handy tool for this purpose is shown at C. This can be either a piece of cold-rolled stock or a piece of stub steel, with a hole drilled in one end slightly larger than the punches, and deep enough to clear the end, as shown in the sketch. If the punches are hardened, it may be better to force them over by peining the pad, as shown at A, by means of the tool B which, instead of being used as a lever, is struck with a small hammer, the high point being forced into the metal at the base of the punch; thus bringing the latter over the desired amount. The point of the tool B should be hardened and tempered.



STRAIGHTENING SMALL PERFORATING PUNCHES.

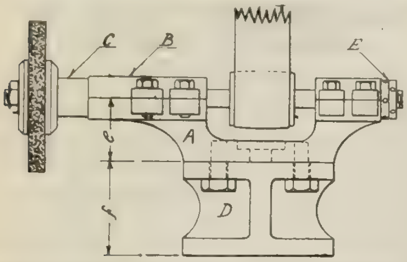
ROUGH, BUT SERVICEABLE GRINDER

By R. James.

OCCASION often arises in small jobbing shops, where it is necessary to use a grinder to finish hardened work, and as many of such plants are not provided with electric grinders, the device used for the purpose is generally one of home-made construction. The sketch herewith shows a simple but serviceable grinder, used in a shop where sheet metal dies are made and repaired. The main casting A, which carries the shaft, is designed to secure good long bearings, the front one being extended to allow of operating on internal surfaces. For bores of small diameter, shaft extensions are screwed to the main shaft. The height (e) is made to conform to that of the smallest lathe on which it may be used, while distance blocks D are provided for use on the larger machines, the height (f) being such as to raise the centre of the wheel to the level of the lathe spindle. Lateral play is eliminated by means of the adjusting nuts E.



ROUGH BUT SERVICEABLE GRINDER.

PROTECTING TUMBLING BARRELS

By D. O. B.

IN many factories the proper guarding of tumbling barrels is not given the necessary attention which the conditions demand. Many cases might be mentioned in which accidents have happened in this connection. In the cut is shown the method of protecting tumbling barrels as employed in one large agricultural plant. These guards are constructed of one-inch pipe with ordinary woven wire across the upper halves. They are merely dropped into holes in the floor and held by flat braces attached to the pedestals. These guards are extremely effective, and prevent anyone coming in contact with the moving barrels, yet at the same time being readily removable.

GUARDS MADE OF WOVEN WIRE AND PIPE FOR PROTECTING TUMBLING BARRELS.

A SCREW MACHINE TOOL

By D. S. Mann.

HAVING to machine a large number of cast-iron pieces of the shape shown in Fig. 1, it was decided to put the job on a small screw-machine. These pieces were drilled and reamed, faced on the end and turned on the outside for a short distance from the end in order to give a finished appearance when assembled. The pieces were chucked and all the operations with the exception of reaming performed with the tool shown in Fig 2. The drill was held in the regulation manner in one of the turret holes and the tool clamped directly on the drill body. This was a steel casting, split and provided with a screw for clamping. The two projecting lugs each carried a tool which completed the turning on the outside, these tools coming into action when the drill entered to the requisite depth. After turning off the outside, the feed was thrown out and the end faced with the two tools set directly into the body. This then completed the three operations in the time ordinarily required for the drilling. The same tool could just as conveniently be used in the drill press. Oftentimes large bosses occur on castings where it is impossible to turn them on the outside in any other way.

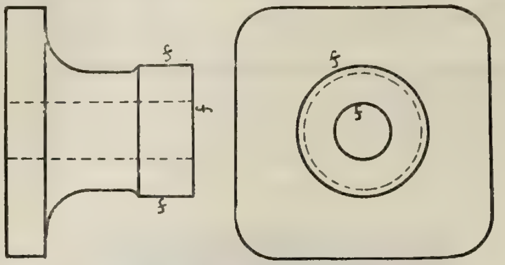

FIG. 1.—PIECE FOR WHICH TOOL SHOWN IN FIG. 2 WAS DESIGNED.

MOULDING AN ANGLE IRON FORMER CASTING WITHOUT A PATTERN

By J. H. Eastham

A RUSH order for a number of 24 inch diameter angle iron rings of 1 inch by 1 inch by 3-16 inch section necessitated the provision of a former casting of dimensions and shape as shown at Figure 1, the order for this casting being handed over from the blacksmith department to the foundry at four o'clock in the afternoon, with a request that the piece be delivered the following morning without fail. Obviously, at that late hour, time to make a pattern, except of the crudest type, was out of the question, hence the introduction of the material and means of production described herewith.

Preparatory Operations

A circle 24¼ in. dia. was marked out on the smithy floor, and a piece of 2 in. by ¼ in. flat was heated, its outside face bent to the radius just described as accurately as possible, cut off at twenty inches long from tip to tip, cooled, and handed over to the foundry foreman. Meantime a bed had been leveled and struck off on two straight-edges 24 in. long, and placed 18 in. apart, while a wooden wedge A, Fig. 2, was driven in level with the surface at the point indicated to serve as a support for one end of the trammels which are now employed to mark the outer radius as shown. This radius was 12⅛ in., the extra ⅛ being contraction allowance.

The wedge was now withdrawn, moved back three inches to position B.

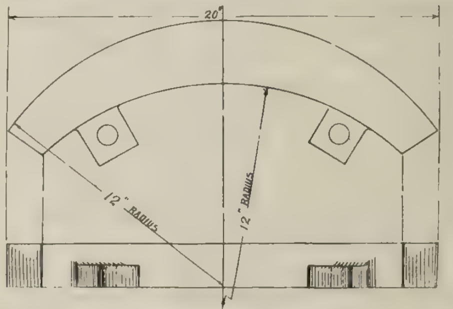

FIG. 1. PARTICULARS OF FORMER BLOCK TO BE MOULDED.

and again driven in to act as centre for a curve of the same radius which is drawn out on the bed to mark off the inside surface of the casting.

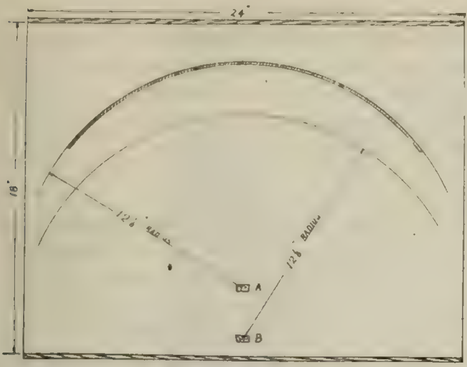

FIG. 2. IRON HOOP IN POSITION FOR RAMMING UP.

Ramming the Hoop Iron

The hoop iron segment was now laid on the bed, its outer face touching the outer circle as in Fig. 2, rammed up on the outside only and then drawn forward till its inner face touched the circle struck from wedge B. Sand was then rammed to its inner surface, and strickled off level, the hoop being next finally removed, leaving a mould which, after the ends were stopped in by the aid of a 2 in. flat strip, measured 20 in. long over all, 2 in. square at each end, and 2 in. deep by 3 in. wide at the centre. The extra thickness at that point was desirable, as that particular place the former block would naturally receive the maximum number of blows with consequent tendency to facture, if of too light a section. The mould at this stage and previous to withdrawal of the hoop pattern is shown at Fig. 3, both radii being shown at the end or 2 in. square section of the casting.

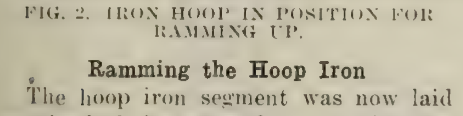

FIG. 3. SECTION OF RAMMED MOULD.

Cutting and Coring Lugs

The lugs needed to secure the former block to a foundation plate whilst in use were next cut out with trowel and cleaner, being approximately 2 in. by 2 in. across, and 1 in. deep, and heavily filleted on their under and outer junctions with the main casting, a coreprint $\frac{3}{4}$ in. dia. being next sunk in the centre of each.

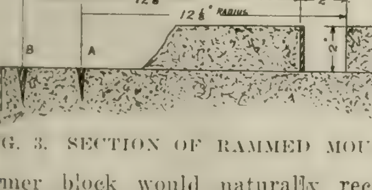

FIG. 4. SECTIONAL VIEW OF MOULD READY FOR POURING.

Pieces of $\frac{3}{4}$ in. round stock core were now sawn off to the required length, and pushed down till level with the joint, the holes formed by these cores being intended to accomodate $\frac{5}{8}$ in. bolts, which, along with the size and location of the lugs were considered ample to secure the greatest degree of rigidity whilst in use.

Slabs of core, one inch thick were now filed to fan shaped sections to suit the circular mould and placed end to end in the form of a cover, one being pierced with a one inch round hole to facilitate pouring.

These cores, with pouring arrangement, are shown in the cross sectional view of the finished mould Fig. 4, as well as in plan in the composite view Fig. 5.

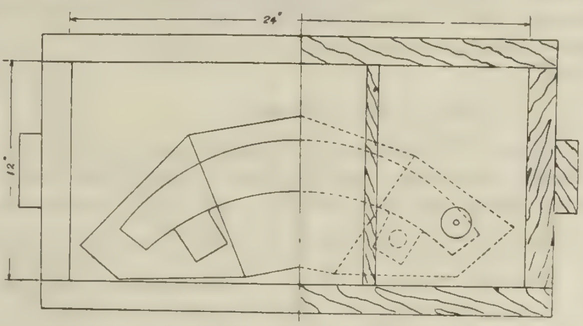

FIG. 5. PLAN VIEW OF MOULD SHOWING SLABS OF CORE.

Forming Cope and Pouring

Sand was now rammed lightly round the entire mould and the slab cores, up to their upper surface, and struck off to a level joint, and a 24 in. by 12 in. cope part was rammed up over the whole, to prevent displacement of the cores when pouring. The mould was then weighted and cast, well inside the stipulated time, a little grinding of the marks caused by the core joints being the only treatment the casting required after rumbling.

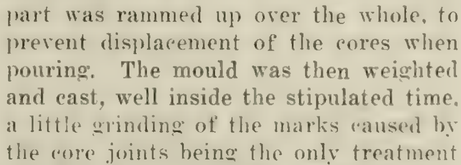
DRILL JIG FOR SMALL SHELLS

By R. E. N.

THE accompanying sketch illustrates a useful jig for drilling the small grub screw hole in the noses of the shells. The pocket in the piece A is bored out to fit the nose of the shell, and the hole for the drill bush B located in the desired position. The vee block C is shaped out so that the centre line of shell will be parallel with the base of the jig. The lug D is tapped out to receive the screw E upon which the wheel F is secured. The operation is rapid and very satisfactory.



DRILL JIG FOR SMALL SHELLS.

* * *

THE COST OF MUNITIONS

IN the first and second reports from the Committee of Public Accounts, under the heading "Vote for the Ministry of Munitions of War," particulars are given with regard to the cost of shell, from which it appears that this has now been reduced from 25 to 30 per cent., compared with the prices paid during the early period of the war. It appears that whereas the cost of the 18-pounder bodies was formerly from $4.86 to $5.61, the price has now been cut to $3.04. The prices prices for 4.5 shell ranged between $11.40 and $15.80, and these have now been cut down to $8.10. Sixty-pounders that formerly cost from $15.35 to $20, are now cut down to $12.75. The 6-in. shells which cost from $19.44 to $24 formerly, are now being made for $17; the 9.2-in. shells which now cost $55.28, formerly cost from $63.80 to $74.10. As complaints have been made that the Ministry of Munitions did not appear to deal equitably with the small producers of shell, it is interesting to note that an attempt has been made by this department to regulate, to some extent, the prices paid in inverse proportion to the output; that is to say, the prices paid to the smaller makers are somewhat higher than those to the larger producers.

A range of prices was fixed by the department running from the works producing 200 per week to the firms producing 2,000. The 200 per week shop was cut to $3.90, and the 2,000 per week shop to $3.40 on the 18-pounder shell. For quantities over 2,000, contracts are made as low as $3.05. With regard to the 4.5 Mark V. shell, makers of not more than 200 per week received $11.20 per shell body, while contractors for 1,500 per week were paid $9.50. In these cases the forgings were supplied by the Ministry to the works at a specific price. The 4.5 in. shell forgings were charged at the rate of $4.35 each. As the forgings were bought at $3.15, the Government was getting a set-off of about $1.20.

It appears from the evidence given by S. H. Lever to the committee, that these new prices have been fixed as a result of a system of costing in the national shell factories, from which a monthly return in detail of the cost of each shell is furnished. The cost covers labor, material, and all overhead expenses, except depreciation of plant and interest on capital, and in many cases where services are given free. The management salaries are not included.

Machine Shop Equipment, Methods and Processes[*]--III.

By E. R. Norris[**]

Since recent events have demonstrated so strikingly the reliance which must be placed by a nation on its engineering industry as a factor in modern warfare, the subject of the above title assumes a place of importance not previously awarded it by people in general. While not dealing specifically with munitions or other similar product, the application of the principles contained therein may be done with profit in all branches of engineering.

SINCE Mr. E. G. Acheson produced the substance known as Carborundum, about twenty-five years ago, investigators and manufacturers of abrasives have given great attention to the grain, grade and bonding of their products, with the result that to day we have abrasive wheels and discs of emery, Carborundum, Aloxite, Alundum and Crystolon in great variety of size, shape, grain and grade, of superior quality, and adapted to a wide range of service.

The demand for accurately finished parts of machinery at a low cost has been largely responsible not only for the development in abrasives, but also for the great improvement in grinding machinery. Since manufacturers of machinery began to realize that abrasive discs and wheels were truly cutting instruments, in which innumerable cutting points and edges were presented to the work, much work that was previously performed on millers, planers and lathes has been tranferred to the grinders.

Dry Disc Grinding Versus Milling

Considerable saving is being effected by the use of disc grinders on many flat surfaces that were formerly milled. This is more noticeable in dealing with castings that are liable to be chilled and brittle. Grinding also possesses decided advantages where the shape of the casting or forging is such that, in order to prevent springing, great care is necessary in chucking or clamping the work in the milling machine.

Motor driven, double disc grinders are in use, in which the discs are of steel, 23 inches (584.2 mm) diameter and running at 1450 revolutions per minute. The abrasive circles are glued to the discs by a cold glue, which is readily soluble in water. When the abrasive circle becomes somewhat worn, it may be used on the corners or edges of work or upon work which presents surfaces of comparatively small area, and when worn out, the abrasive circle may be removed from the steel disc by immersion in a tank of warm water. As disc grinders of this kind are invariably dry grinders, they must be connected up with a dust extracting system, and on account of the dust, it is not considered good practice to install these machines near other machinery.

In another type of disc grinder, two constant-speed motors are used, one of which is fixed on the bed, while the position of the other is adjustable along the bed by means of rack and pinion. The spindle of this latter motor, together with its grinding disc, is adjustable in a longitudinal direction and may be controlled by a micrometer stop. By this means, work having parallel surfaces may often be rapidly and accurately finished.

Use of Ring Wheels.

Instead of the abrasive circles mentioned above, ring wheels may be used with advantage for roughing off scale and stock which is too rough to be ground economically by abrasive cloth circles. There is another advantage possessed by the ring wheel, in that the life of the wheel is much longer than that of the abrasive circle. The case of the grid cited above furnishes a good example of the relative wear of circle and wheel. Wheels of 15-inch (381 mm) outside diameter, 9inch (228.6 mm) inside diameter and 3 inches (76.2 mm) thickness were used instead of abrasive cloth circles, and it was found that each wheel was worn down 1-16 inch (1.59 mm) on the face after one month's work; whereas, two abrasive circles are usually worn out by 4 days' work.

Another form of dry disc grinder has a disc 48 inches (1.219 metres) diameter which rotates at the rate of 400 r.p.m. in a horizontal plane. This machine represents the most recent addition to the family of dry disc grinders, and is remarkably efficient on certain kinds of work. Its chief peculiarity lies in the fact that the work bears directly on the abrasive and is ground by the pressure exerted by its own weight, hence, frail castings which are difficult to machine on the milling machines because of the tendency to spring while being clamped, may, in many instances, be faced truly and economically by this process, which requires comparatively unskilled labor. Figure 3 is taken from castings which have been faced by the horizontal grinding process, and the following table shows the savings due to this method.

Name of Piece.	Operation.	Time on Milling Mach.	Time on Grinder.	Time Saved Each Piece.
JJunction Box, "A"	Face	16 min.	3 min.	13 min.
Controller Base, "B"	Face Bosses	10 min.	3 min.	7 min.
Half Bearing, "C"	Face Joint	7 min.	1¾ min.	5¼ min.

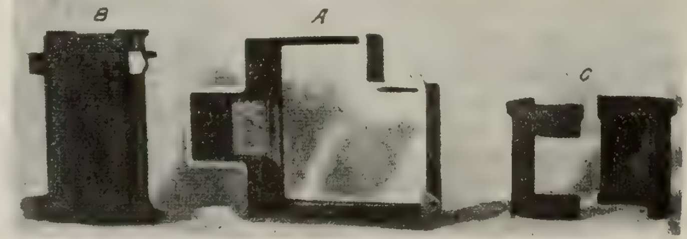


FIG. 3. TYPICAL SAMPLES OF WORK FACED ON HORIZONTAL GRINDING MACHINE.

Wet Grinding.

For the production of true flat surfaces on hardened-steel punches and dies, the vertical surface grinder has been found highly efficient. A cup wheel 16 inches (406.4 mm) in outside diameter, running at a constant speed of 1000 r.p.m. is used. The work is held and presented to the wheel by means of a strong magnetic chuck, which forms the machine table; this latter has six different speeds of rotation. The feed mechanism is so graded as to allow of feeds ranging from 0.0002 inches (0.005 mm) to 0.005 inch (0.127 mm) in increments of 0.0002 (0.005 mm). A sheet iron guard surrounds the wheel, and splash guards prevent the cutting compound from being thrown beyond the machine.

---

[*] A paper presented at the International Engineering Congress at San Francisco, 1915.

[**] Director of Manufacturing Operations, Westinghouse Electric & Mfg. Co., East Pittsburgh.

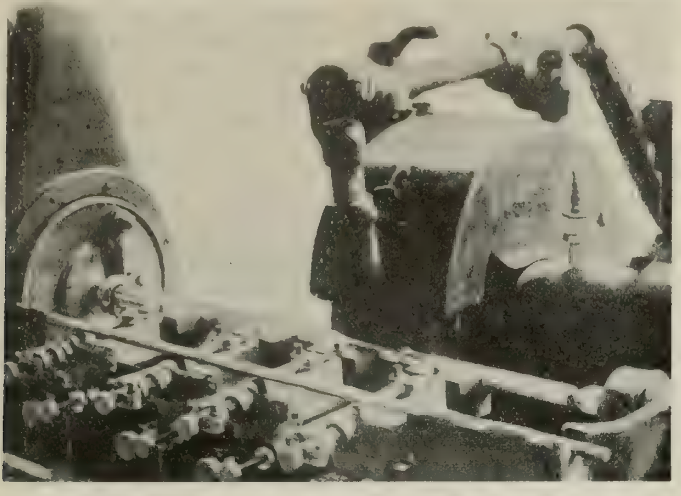

FIG. 4. SLAB-GRINDING A SHAFT 1¼ IN. DIA. X 30 IN. LONG.

Much of the work now done on the vertical machines was formerly done on grinders of an old type, having horizontal spindles and cylindric wheels. The superiority of the vertical machine is due chiefly to the adjustable feeds and speeds, also to the method of chucking and face contact instead of line contact of the wheel.

In the up-keep of wheels, the vertical grinder costs five times more than the obsolete horizontal machines mentioned above, but since the vertical grinder produces from 50 to 75 per cent. more work, the wheel cost per die is very little more. On small dies, having surfaces up to, say 3inch by 6-inch (76.2 by 152.4 mm), the saving due to the vertical machine is about 75 per cent.; on large dies up to 30inch (762 mm) dia. (the maximum capacity of the machine), the saving is about 50 per cent.

Cylindric Grinding.

The finishing of cylindric surfaces on cast iron and steel by grinding has been a well established machine shop process for many years. It is common practice on shaft grinding up to 6 inches (152.4 mm) diameter to use wheels of 2 inches (50.8 mm) face, and to give a work traverse of from ½ to ¾ of the wheel width per revolution of the work. With the correct combination of work and wheel speeds, wheel grain, grade and materials, each pass of the wheel, when roughing, may remove from 0.003 to 0.004 inches (0.076 to 0.102 mm) from the diameter of the shaft. At the end of each stroke, or pass, the longitudinal movement, or traverse, is suspended, while the work makes from one to two revolutions. The total number of passes required to rough grind any fit, therefore, depends on the amount of stock which has been allowed for grinding. This allowance varies considerably in different machine shops according to the class of work, the condition of the roughing lathes and the inspection of the roughturned shafting. In general, however, the amount allowed for grinding depends on the diameter and the length of the work and tables have been constructed which give this allowance for any shaft of given diameter and length. From what has just been said, it is evident that a considerable reduction in grinding time may be effected by increasing the width of wheel. In the latest development of cylindric grinding, which someone has called "slabbing," the advantages of the very wide wheel are obtained. This new method appears to have possibilities which are limited only by the width of the grinding wheel and the rigidity of the machine. Fig. 4 shows the application of the "slabbing" process to a 1.4 inch (35.56 mm) diameter by 30-inch (762 mm) long shaft; from which it will be seen that, with the exception of one fit, the wheel exceeds the length of each shaft fit. By this means, the end traverse of wheel or work is in a large measure eliminated, and a corresponding decrease in grinding time realized.

File Sharpening.

Although for a number of years attempts at file sharpening have been made, it is only within the last few years that the process has become a commercial success. A sand blasting apparatus is being used for file sharpening, with success, by several large manufacturing establishments. This apparatus consists of a sheet-iron chamber provided with uptake, settling tank, slurry mixing-tank, slurry overflow-pipe, air agitating pipe and slurry projector. A door gives access to the inside of the chamber. The slurry projector is inclined to the horizontal at an angle of 25 degrees, and the nozzle extends slightly within the chamber. This projector consists essentially of a bronze body to which are fitted steam pipe, slurry suction-pipe and nozzle. The steam supplies sufficient water for the slurry.

The files are sharpened by being held in the slurry jet in such a manner as to expose the backs of the file teeth to the cutting action of the sand. After the file has been sharpened, it is cleaned and dried by the steam, after the slurry supply has been cut off by a foot lever.

Success in file sharpening depends on the skilful selection of the files to be sharpened, maintenance of the correct angle between files and jet while sharpening, and the selection of a suitable sand. Experience shows that a sharpened file often does as much work as a new one, and the cost of sharpening averages about one-fifth of the cost of new files. The following results have been obtained under ordinary manufacturing conditions and may be taken as representative of the economies which are effected by the efficient use of this apparatus.

Treated No. of Files	Size	Total Cost Blasting Sand	Price Recut	Price Files of New
109	4 in. files	$0.88	$	$ 11.99
1245	6 in. files	9.96	....	136.95
1333	8 in. files	14.20	....	199.95
943	10 in. files	15.07	56.00	169.74
1206	12 in. files	28.98	96.48	241.20
831	14 in. files	26.69	99.72	174.51
566	16 in. files	22.64	90.56	124.52
143	18 in. files	6.28	27.17	34.32

Electric Driving of Machine Tools

That the electrically-driven machine shop possesses advantages, is evident from the rapidity with which electric driving has been substituted for mechanical driving. Among the advantages claimed for electric driving are the following:—

Power may frequently be obtained from a public supply corporation at a less cost than would be possible were it generated in a private power station. In such a case the first cost of a private generating plant is unnecessary.

When an electrically driven shop, having its own power station, is in the vicinity of a public supply system, power may be obtained for machine shop purposes when the private station is idle.

Where electric driving is used, the position of the power house may be determined by a convenient source of fuel and water supply and facilities for the dispesal of ash; whereas, mechanical transmission usually makes a definite relation of machine shop and power house imperative.

Transmission shafts, counter shafts, fixings and belts, with their expensive delays and repairs, are eliminated. As a result of the elimination of belting, there is less obstruction to light.

Electrically driven machinery may usually be more easily arranged to suit the sequence of manufacturing operations, and where the machines are individually driven, any machine may be operated irrespective of others. Closer and more conveniently obtainable cutting speed regulation, with a consequent increase of from 15 to 25 per cent. in output, together with a great reduction of moving parts, is usually made possible by the substitution of electric for mechanical control of machine tools.

Great improvements have been made recently in the design and construction of machine shop electrical equipment. Motors have been reduced in weight and increased in mechanical strength by the substitution of pressed steel for cast iron and cast steel. Automatic starters and controllers have been improved and are now used to advantage on machines which are frequently started and stopped.

Advantages of Electric Control

Among the advantages secured by automatic control—sometimes called "push button" control—may be cited the following:—

Simplicity and safety in operation.

Speed regulation to suit the hardness of material to be cut.

Protection of motor from excessive starting current.

Protection of motor from overload.

Convenient location of the push buttons greatly facilitates the setting up of work on the machine. This feature is highly desirable for planers and boring mills. A very full description of automatic control for industrial motors may be found in the Electric Journal of December, 1914.

It frequently happens that existing machine tools may be readily altered and greatly improved by the substitution of electrical for mechanical control, as in the following case: A lathe, in which the work speeds were obtained through numerous spur gears, clutches, levers, and fittings, had caused considerable expense and delay due to repairs, and it was decided that a change from mechanical to electric control should be tried, as a possible means of reducing the repair bill. Fourteen spur gears, two double clutches and their levers and fittings were removed from the headstock and an adjustable speed motor and controller were installed. After the change, instead of the nine original speeds, thirty-two were available under the new conditions. In addition to the advantages of closer speed regulation and reduction of wearing parts, an appreciable reduction in power used is recorded, and speed changes are obtained with less effort.

Conclusion

From what has been said with reference to modern cutting tools and machinery, it is evident that rapid advances have been made in machine shop methods and equipment; it is also a fact that the cost of equipment has increased greatly. Also, the first cost of buildings, with the superior hygienic conditions under which men work; the increased cost of management due to the more highly developed and complex conufacturing conditions and competition; and other items connected with the production of machinery, all combine to swell the total overhead factory expense. Under these circumstances, it is essential that a high state of efficiency be maintained in the machine shop, and this can be secured only when the machinery is kept running at or near its maximum capacity. There are many factors involved in the realization of this latter condition, not the least of which is the ability of the machine tool operator; and in order that the operator may work to the best advantage, it is now customary, in large organizations where a great many tools are used, to employ a staff of expert demonstrators, whose business it is to instruct operators and demonstrate the capabilities of machines. The demonstrator is also expected to keep himself abreast of the latest developments in this class of work, and to devise means for simplifying and improving machining operations. The paper read by Mr. G. O. Gridley, on "Safe Selling Guarantees" before the National Machine Tool Builders' Association, in the fall of 1913, brings out very forcibly the benefits to be derived by machine tool builders from the demonstration of the value of their machinery.

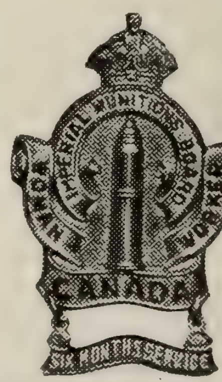
The buyer of machinery is naturally influenced by the design and workmanship in the tools offered, but, generally speaking, his final decision in making a purchase will rest upon the quantity and quality of the work which the tools will produce in a definite time and under working conditions which are conducive to a reasonably long period of usefulness and efficiency. Therefore, the machine tool builders who are in a position to study the requirements of their customers and to furnish data as to how work should be done and the time in which the work can be done, have decided advantages over those who do not render such service. The market now offers a great many competitive machines for doing practically the same class of work, and it is not to be expected that the users can always accurately decide what is best for their requirements.

Before making a guarantee that a machine tool will perform a definite piece of work in a certain time, the builder of the machine should be in a position to demonstrate that the work can be performed in the time specified; otherwise, it is unsafe to make such a guarantee. Actual demonstration is convincing, and its influence as a selling agent is very far reaching. Demonstration provides a means of obtaining the most suitable arrangement of tools and the best combination of feeds, speeds, and cuts for the work in hand. During a demonstration, an itemized record, or time study, can be made of the operations, the material, the cutting feeds, speeds or cuts, the handling time and the time consumed in manipulating the machine. Such records, when conveniently filed, form a valuable source of information, which may be used to advantage when estimating the cost of similar work.

◆

OFFICIAL BADGE FOR WOMEN WORKERS

WOMEN munition workers are to receive official recognition from the Imperial Munition Board, and with this end in view an official badge has been issued by the Board which will be given to each woman munition worker who has been engaged in the manufacture of munitions for thirty days. The badge is unique and of interesting design, showing a completed artillery shell in its cartridge case on a shield surmounted with a crown, and with scroll work carrying the words: "Woman Worker" and "Imperial Munitions Board," with "Canada" beneath. A feature of the badge analogous to the bars on military medals will be a service bar bearing the words, "six months' service," which will be attached below the badge, an additional bar being added for each six months of continuous work at one plant.



OFFICIAL BADGE FOR WOMEN MUNITION WORKERS.

CULTIVATING THE INITIATIVE

By A. E. R.

NO man should content himself with absolute subordination. Strict obedience is very often a highly desirable factor; but to carry it to extremes, at the expense of personality, is to sacrifice all self-respect and confidence in one's personal ability. Original thought and individual initiative have invariably been two of the greatest forces in the advancement of mankind; the first—whether visionary or the development of previous ideas—has always found expression in the latter, where an active brain and willing hand has been ready to put into concrete form the fruits of mental conception.

Everyday Requirements.

Workmen should always be mentally alert; quick to see an opportunity wherein their own and the firm's interests can be advanced. Because work has been performed in a certain way for a long period of time, is no reason that it should be accomplished in the same identical way indefinitely. While in the majority of cases, present methods of doing certain operations might not very well be improved on, there are many instances where a little thought, logically applied, would greatly increase the productiveness of a man or machine; often eliminating much labor otherwise uselessly expended.

A man's loyalty to the firm may be shown in the implicit way he follows the directions of his superiors, and yet he may be quite indifferent to efficiency possibilities that would be clear to a more receptive mind or observant eye.

How Initiative Originates.

Concentration of thought upon the work in hand is the forerunner of a creative mind. While many trains of thought carry no freight, the essential factor is to keep the train moving, so as to be in a position to take on freight when the opportunity offers.

When men are enthusiastic about their work, their minds are alert, they are productive, prolific in ideas, original, creative, strong and effective. What hope of advancement is there for the man who can only answer, "I do not know"?

Fruitful Criticism.

One of the best ways of cultivating the creative thought, is to study the methods of the other fellow; not with the purpose of adopting his ideas, but to see wherein any particular principle may fit in with your own line of work, and at the same time become conversant with progressive and up-to-date equipment. Few workmen, however, have the opportunity of studying this development by actual observation, owing to the small circle in which their practical experience is confined.

Trade Journals Helpful

The one best method for the isolated mechanic to obtain the current trade progress, is to avail himself of this privilege through the medium of the trade paper, which reflects in print the latest improvements of that particular field of industry. The careful and conscientious study of these pages broaden and train the mind to think out original and effective ideas for individual and collective benefit. The circulation of ideas among different shops stimulates thought all along the line.

Discourage Discouragement

No man should be discouraged because his first attempt at original thought has not met the approval of his immediate superiors. Your proposal may even be resented, but do not get "cold feet," it is a weak man that cannot rise after being knocked down. The man that suggested floating iron boats was termed a fool; wireless telegraphy was laughed at when first spoken of; a railroad president had no time to waste with George Westinghouse when he wished to "stop a train with wind." So it has been with many new ideas that have afterwards proven beneficial to the human race.

Great achievements are possibly not open to everyone, but even the most insignificant improvement is often the first step towards higher and more important goals. Never before was there such a demand for the resourceful man; the man who can think, who can devise, and who can put his thoughts into execution.

◆

RECOGNITION OF ABILITY

By R. Hamilton.

ONE of the agents that tend to destroy the spirit of loyalty, is the lack of appreciation accorded for work well done. In many instances this reasoning does not apply; but where it does, the seed of dissatisfaction once planted, may ultimately grow up and stunt the growth of the surrounding grain. It is generally recognized that the foreman is responsible for the efficiency of his department, and to maintain a high standard it is essential that the shop associations should be of such a nature, that the workmen can be relied upon to put forward their best efforts at all times.

Men Are Not Machines

Men should not be considered solely as units of a productive force, for unless an essence of goodwill permeates the whole plant, loyalty to the firm will gradually disappear, and the value of the men will deteriorate. Treat a workman as your slave, and you will get from him sullen service; and a half-hearted service means limited and inferior production. Consider him as a co-worker; one whose efforts are not only satisfactory, but appreciated, and an important part of your high efficiency problem will be solved, so far as output is concerned.

Need for Personal Judgment

It is the workman's privilege to improve his opportunities, and his superior's duty to see that he gets them. Men should be encouraged to use their own judgment in many of the minor details of their work. Profitable results are very often obtained by men "thinking" of their work in addition to doing it.

Although the foreman is nominally in charge of the shop, and ordinarily supposed to answer "shop" questions, it behooves all men to practice the analyzing of detail problems, the simpleness of which often try the patience of the best of foremen. And then again, there are men in authority who are so self-conscious of their own limited accomplishments, that they are reluctant to accept suggestions from the men under them. However, the world—at least the mechanical world—is making such rapid strides that no one man's past or present experience is so broad that he can lay claim to a monopoly of original thoughts or ideas

Ridicule Kills

Do not despise or ridicule the well-meant suggestion of an interested shop man. Nothing will "kill" a man quicker than to ignore his proferred aid in the solution of a shop problem. Ideas are sometimes advanced by the men in the shop for the improvement of certain tools or devices, which the foremen reject at the time ,and afterwards use with some small alterations; but the "powers that be" are under the impression that the saving is the work of the foreman and not the man.

A Steal

A case is recalled where the foreman

actually ''takes'' the credit at the very moment the suggestion is offered. A thoughtful planer hand seeing where he could save considerable time by the use of a certain fixture, explained in detail his idea to the foreman. Just as the latter was convinced of the advantage to be gained, the manager comes along and is advised by the foreman that, '' 'I' have just thought out a plan where we can make a saving of 25 per cent. on this operation.'' The device was designed and constructed, but it was the means of ''killing'' the real author, with subsequent loss to the firm. While cases similar to that just stated may be exceptions to the general rule, it is often these same exceptions that prove the undoing of some enterprising concern, ''blessed'' with a poor executive.

Ability Seeks Recognition

Men who are keen to recognize their own ability, wish to have it appreciated, and if it is not, these men will invariably seek a position where it is.

Every worker in an organization whose aim is his own advancement and the welfare of the firm, is justly entitled to at least the moral recognition for any suggestion whereby the efficiency of the plant may be increased. To stimulate thought and promote the suggestive idea, every shop should have some organized system to induce the workmen to take an active interest in the economic handling of product and equipment. Money talks, and a small cash consideration for an adopted idea, is nearly always an incentive for future developments of an original nature.

WORKING WITH A PURPOSE

By P. H.

SEARCHING for a job that entails the minimum expenditure of physical labor, for the greatest cash returns, is a trait common to a large number of present-day workmen; in fact, many of those who are now occupying such ''coveted'' positions spend much of their time in abusing the privileges with which they are surrounded. There is something demoralizing in trying to get through life without a struggle.

Helping Others Helps Oneself.

To achieve success in any field of activity, the employee must realize, that while he is working for another, he is nevertheless in business for himself. Every bit of work he does heartily, honestly and thoroughly, is developing his own capacity, making him a bigger, broader, more capable man. Remember that cash remuneration is not the only returns you are receiving for your labors.

Future Assets.

The knowledge that you acquire in the course of your daily ''grind,'' is to be one of the chief assets of the future; therefore, the value that is placed upon your services in after years, will not be, what you have done for your previous boss, but rather what you have learned and can apply profitably to the subsequent positions you are called upon to fill.

The seriousness of life should be impressed upon every young man during the early period of his career. No man should expect to journey through this life without having accomplished, during the passage, something worth while.

Luck Versus Ambition.

That man is destitute of ambition who is content to drift along, passively indifferent to those qualities that make for success. These men, as a rule, will look at the other fellow's advancement as a matter of ''luck,'' never realizing that this good fortune is invariably the result of earnest application and eagerness to excel.

Luck is the tide, nothing more. The strong man rows with it, if it makes toward his goal; he pulls against it if it flows the other way. A man waited for 20 years for an opportunity to come along; becoming weary, he decided to take a nap, and while asleep the opportunity passed him by. A receptive mind, and an alert and creative brain, are the two goal posts through which opportunity scores a goal.

Industrious Idlers.

Idleness, in any form, is not only the key to beggary, but it is cowardly; inasmuch as the portion of life's activity that one person endeavors to avoid must be taken by another. It may be alright to cry aloud that the world owes us a living, but let none of us appease our conscience by letting someone else pay the debt. While idleness is generally supposed to allude to an anti-work habit, this non-productive trait may be exercised during the periods of useful effort in the daily routine of the average man. Some men, knowing they have accomplished a certain job in extra good time, will spend the ''saved'' time in telling their shopmates about it. These men are not only losing the respect of their superiors but what is probably worse, they are putting sand into the foundation of their future character, the stability of which should be one of the first duties of every young man, as his best strength depends upon the materials used in its construction.

Genius Discounts Itself.

A man of genius, one that is truly loyal to his self interest, invariably feels that what he has performed does not do credit to his aim or purpose; while on the other hand, the braggart is content to waste his own and his employer's time by trying to convince others of his own importance.

''Some people, in their lives and in
their labors,
Seem larger to themselves than to
their neighbors.''

No man should be satisfied with doing just what he is told to do and no more. He should strive to overcome the tendency of getting in a rut, out of which it is often very difficult to emerge. Men cannot remain stationary; in whatever sphere they are engaged, they must either advance or retrogress. If a man's fund of experience does not increase his skill and production improve, he must stand idly to one side while others pass him by. Every day should see something added to his store of knowledge, and likewise profit to himself and his employer.

Control Effort.

The cause of many failures is not so much in the lack of effort as in the waste of it. A large amount of energy is often non-productive, where the same amount of inherent power properly expended might accomplish marvelous results.

Have courage to go forward. Don't be afraid to try, even if you fail; remember that a worm is about the only thing that can't fall down. Every earnest determination to remedy a failure or overcome an obstacle, makes the next trial just a little easier. If you cannot surmount a difficulty, take positive hold of it and make it serve you.

ORGANIZATION AND SYSTEM

By A. L. Haas.

CARD indexes, routing memoranda, stores orders, shop orders in duplicate, triplicate, quadruplicate, of every kind and all colors of the rainbow, are the order of the day. In spite of these counsellors of perfection, jobs are delayed, stores may be wasted, and time at so much per hour does get unaccountably lost. It is clear that under no routine, however cleverly planned, can the human factor be eliminated or entirely disregarded.

Routine, system, bookkeeping are all self-acting machines, which should automatically care for some repetition details, and relieve the staff from wasting time. It is, however, easy to make a fetish of what is after all a tool, to regard system as an end in itself. When routine becomes master of the situation it is high time to adjust its incidence. There are present-day instances where foremen have so much daily red tape to wind that clerical duties occupy an inordinate time and impair the real functions of their position.

A Frequent Weakness

Instead of system being an assistance with its literary aspect cared for by a clerical staff, it frequently happens that the latter needlessly consult the shop executive and waste his time. Where the management place greater reliance upon filing cards and data than upon getting work out—and such instances, criminal, though true, are not unusual—the information obtained and the data filed are apt to be unreliable.

It must be remembered that the severest critics of systematic want of common sense are those who have to furnish the needed information; these in too many instances feeling that 50 per cent. of the effort so expended is waste energy. The management who, enthroned in high places, issue general orders and binding instructions, occasionally find some systematic routine valuable, and are apt to pursue this interesting pastime to the bitter end. Never having trod a shop floor in the shoes of a foreman, the fact that a special staff and assistance are needed in the matter does not occur to them.

Common Sense a Requisite

System, whose value is unquestioned, should be permeated with obvious sense, so that those expected to find intervals in a busy day for the due performance of its ritual will be found in sympathy with, and not antagonistic to its forms. Where a trivial order costs the same amount as a $2,500 order for this tool of commerce, it is time for revision. Not merely the profit but the amount of the invoice itself may be devoured by the machine of system.

Now, system and organization are not the same thing; so obvious a fact needs mention since misconceptions are abroad on the subject. Actually, one is the direct complement to the other. Organization supplies, or should supply, the human element, correcting, modifying, or supporting the system by which its decrees are carried into effect. While organization is the life blood of industry, system may be likened to the nerves of the industrial body, it should therefore possess contractile and reflex functions; but, minus the life blood of the organizer, system, while a perfect framework, will not keep away or correct defects. The perfect system is yet to be discovered and each isolated firm finds considerable difference in method from other similar concerns.

Foreman's Duties Executive

Any routine which makes the foreman's life a burden is clearly against efficiency; consideration of this does not get the attention it deserves. Provided that he is capable, it is quite immaterial whether a foreman can read and write; his functions in the shop are executive and not clerical. Being shop organizer, if he be turned into a second rate clerk, his peculiar virtues are placed in a wrong channel and the shop assuredly suffers in more ways than one.

System, then, should be elastic, and of the least burdensome character which it can be made to assume while serving its designed ends. These requirements should be clearly visualized before it is installed. There should be enough horse sense about it so that its value can be recognized and gain the sympathy of those who have to bear the incidence of its burden. If quantities of clerical labor are involved these should, in the main, be in the custody of a clerk, not of an active organizer such as a shop foreman.

Some concerns seem to fear that their shop executives should have a leisure moment, much less an idle hour. Without some leisure for reflection, unhampered by clerical and other duties, it is impossible for the average rational man to exercise foresight, provide for contingency and keep up the personnel under his control to proper pitch. On a lower plane wastage of time, material and stores may go unchecked for want of personal supervision.

System Secondary to Organization

Rational organization should take care of the system, not system rule the organizer. System is, after all, of secondary and not prime importance, however alluring the data it compiles. The main object of the hsop is to turn out good work with maximum production. System and the time it occupies is, after all, an overhead charge to be earned and is no end in itself.

As an instance in point of the unchecked ravages of system—A large concern, whose activities occupy many fields and cover a wide range of specialties, appointed a new works manager. Contrary to previous practice, he insisted on getting into direct touch with the commercial side of the business. He asked for monthly returns of sales for the last five years. From these he prepared what he termed curves of tendency. With this information he went carefully through stock and finished parts in hand, making some rather important discoveries. He calculated that in some instances stock in hand for certain specialties was sufficient to last at least 10 years. In others, odds and ends were being continually made singly. Some stuff was season sales, but stock and finished goods went on being made at one and the same time.

After the entire matter had been thoroughly sifted, he sought audience of his managing directors, the net consequence being that the shareholders got no dividend that year. The system appeared perfect, certain definite amounts of stock being held as spares, and against future orders. As operation was automatic, shop orders to replenish stock issued from the office at regular intervals. Market tendencies were ignored by the system in vogue, also the incidence of season on trade. The passage of years had entrenched the system, while the same interval of time had altered the sales.

System Organized

To-day the management get returns of sales month by month, the tendency curves are plotted and passed to the works manager, who adjusts the quantity of stock, using his knowledge of how the shops are fixed and exercising a balanced judgment as to what is necessary.

It is insisted that the system was good, but very misleading. The distinction between system and organization, it is hoped, is made clearer by the instance cited.

While system without due organization may bring the large firm into trouble, in the small shop the lack of both sometimes conjures up a gentleman known to fame as the official receiver.

In the small shop, where one single brain can carry the whole business, there is perhaps little loss in the want of system. It is when the particular brain ceases, or the business grows that an element of order must perforce be introduced. Possibly the efforts of the small shop at this stage of the evolution are of supreme interest. The men grow restless under the supposed slur on their honesty, and think the checking out and in and the exercise of automatic supervision unnecessary and rather childish.

One Man Organization

A man who took over the management of a country shop found his life not a bed of roses when, after a decent interval, he decided to re-organize. The troubles were rendered more acute by reason of the necessity for relying upon the memory of the men for details of repeat jobs, as no records were previously kept. Bare material and other things were stored in the open and castings in heaps. The scrap heap of considerable dimensions, was a local mine where material was obtained for odd jobs. The time lost looking for sizeable pieces was never added to the bill and this obviously overset the advantages of the practice.

The junk pile was duly sacrificed to the foundry or sold, quite a proportion placed in proper custody, properly sorted out, and a primitive, but efficient system installed. The bar material went into racks, and bit by bit, with patience and tact, difficulties were straightened out. Grumbles were heard, but the man in question enlisted the sympathy of the employees, who soon found the benefit accruing from the changes, and the shop is now in a flourishing shape, with the relations between worker and management excellent.

System, organization, and a live man, in co-operation, is the real ideal to be sought. All three are necessary, especially the live man.

PROGRESS IN NEW EQUIPMENT

A Record of New and Improved Machinery and Accessories for the Machine, Pattern, Boiler and Blacksmith Shops, Planing Mill, Foundry and Power Plant

GEARED HEAD FOR SCREW MACHINES

INSTANTLY obtainable speed changes and increased pulling power due to the high belt speed employable, are two of the principal reasons for the growing demand for single pulley drive machines. An interesting example of this type of drive is shown in Figs. 1 and 2 which illustrate an all geared head recently designed by the Foster Machine Co., Elkhart, Ind.

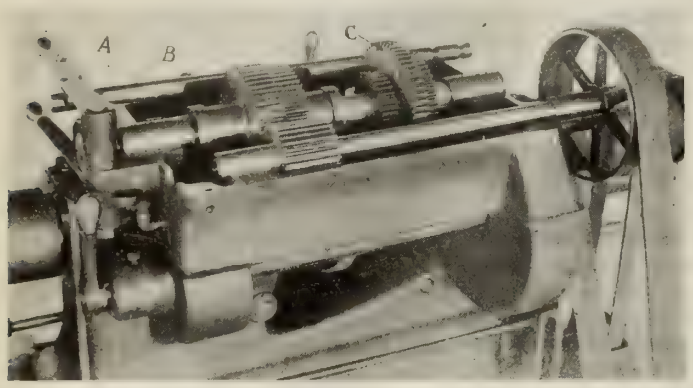

FIG. 1. UNIT GEARED HEAD FOR SCREW MACHINES.

This head is designed on the unit principle so that while in itself it is new, it may be fitted to the standard Foster No. 5 screw machine. In order to do this the cone pulley of the standard machine is removed from the spindle and replaced by a three gear cluster, which engages with the various diameters of a triple sliding gear mounted on a shaft directly above the spindle. This sliding gear is shown in Fig. 1, the method of operating being by a rod A, and hand lever B, a slot in the rod engaging the largest diameter of sliding gear C. The sliding gear shaft is journaled in bronze boxes carby the main head casting.

On this same shaft are mounted two friction driven gears with a cone type of friction clutch arranged to engage either of them for the purpose of stopping, starting, and reversing, one of the friction gears meshing with a reverse idler gear which is just visible below the driving pinion on the pulley shaft in Fig. 1.

The driving pulley is 10 in. dia. by $2\frac{1}{2}$ in. wide and is run at 900 revs. per min. giving a belt speed of 2,350 ft. per min., which under ordinary conditions will deliver 6.2 horse-power to the machine. General requirements however do not call for more than 2 horse-power and in Fig. 2, a General Electric motor of this capacity at 1,800 revs. per min. is shown mounted on the rear side of the leg, the small size of the motor permissible due to the high belt speed employed, being very apparent. Belt guards of very efficient design are fitted, while if desired, the machine can be driven equally as satisfactorily from a line shaft with ordinary countershaft gear.

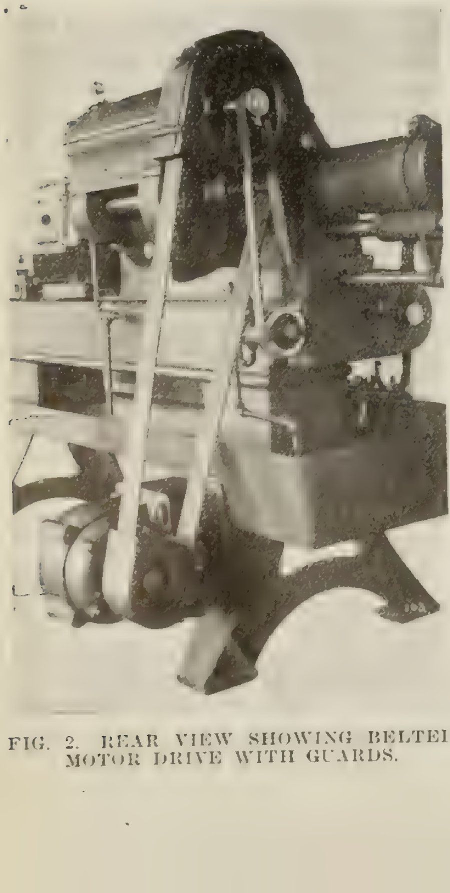

FIG. 2. REAR VIEW SHOWING BELTED MOTOR DRIVE WITH GUARDS.

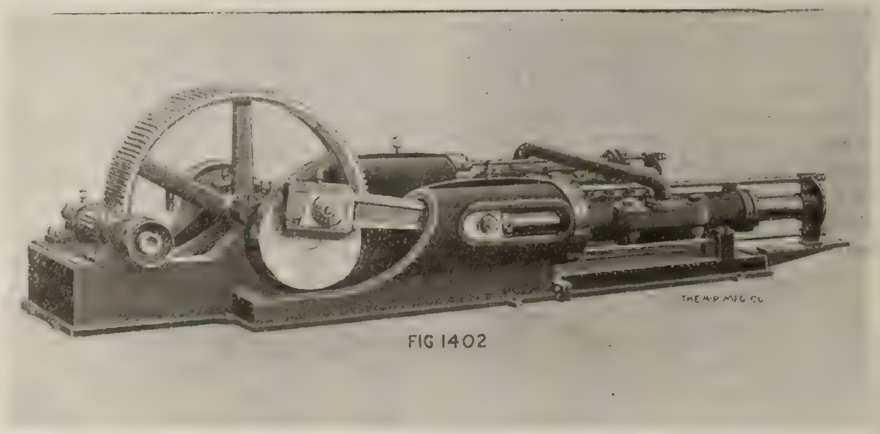
Six speed changes are obtained through the geared head, ranging in geometrical progression from 34 to 466 revs. per min. The collet type chuck regularly supplied, has a capacity of 1 13-16 in. and swing over cut off slide $8\frac{1}{4}$ in. the cut off carriage being equipped with hand longitudinal, and power cross feed with four feed changes.

*

MOTOR DRIVEN FOUR PLUNGER HORIZONTAL HYDRAULIC PUMP

THE hydraulic pump illustrated by the accompanying photograph is a recent addition to the extensive line of high pressure hydraulic pumps built by The Hydraulic Press Mfg. Co., Mount Gilead, Ohio. It is of the horizontal, four-plunger type and designed to fill the requirements for a simple, heavy duty hydraulic pump for supplying a large volume of water or other fluid against a high pressure.

It is designed so that it may be equipped with sixteen different sizes of plungers ranging from $1\frac{3}{8}$ inches to 5 inches in diameter, advancing by quarter inches. The water cylinders are made of forged steel for the highest pressures. For the medium pressures, 1500 to 2900 lbs. per sq. in. inclusive, cast steel is used, and for the lowest pressures the cylinders are semi-steel. The pressures range from 9500 to 700 lbs. per sq. in., and the water capacity from 24 to 326 gals. per min. All sizes have bronze valve seats and bronze or nickel steel valves.



MOTOR-DRIVEN HORIZONTAL HIGH PRESSURE HYDRAULIC PUMP.

The pump illustrated is built for motor drive, requires 150 horse power to operate, and is equipped with a flexible shaft coupling for motor connection. Any motor having a speed of from 450 revs. per min. to 750 revs. per min. may be used. The speed of the shaft is 60 revs. per min. The stroke of the plungers is 16 inches, the two cranks being set at 90 degs. so that a more uniform flow of fluid may be obtained than with a triplex pump.

At all points where the strain and wear is most severe, the parts such as main bearings, connecting rod ends, cross head guides, valves and valve seats, are of easy access for adjustment and replacement. The frame or pump bed consists of two heavy castings securely bolted together, the cross head guides and main bearing containers being machined in the frame. This insures perfect alignment and gives the most rigid construction. The pump occupies a floor space 18 feet, 8 inches in length by 6 feet, 10 inches in width. While the illustration shows the pump equipped with a spur gear and pinion, it may also be equipped with a herringbone gear and pinion.

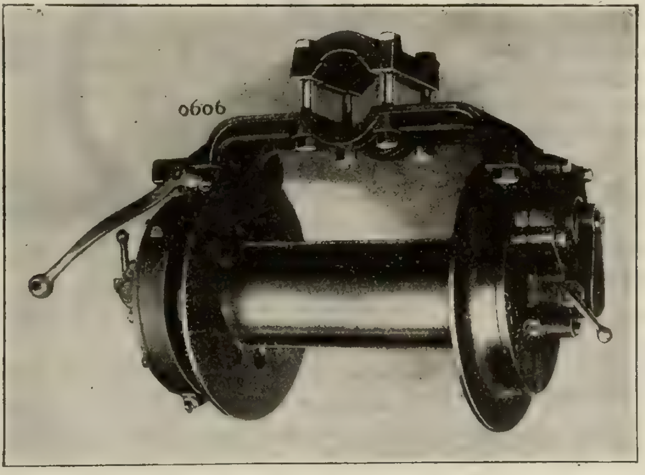
SPECIAL LATHE WITH THREAD MILLING ATTACHMENT

THE illustration shown herewith represents the latest development by the Gisholt Machine Co., Madison, Wis., of a special machine for performing the operations of boring, facing, and thread milling in the base or in the nose of shells. It can be adapted for cutting either right or left-hand threads, internal or external, U. S. standard or metric. The machine illustrated has a nominal swing of 25 in. with 10 ft. bed, and will handle shells up to 12 in. dia., while a larger machine, 29 in. swing with 16 ft. bed, will handle shells up to 16 in. dia.

This machine has been primarily designed to overcome the difficulty, generally experienced among shell makers, of securing a perfect thread when it is necessary to re-chuck the work for the threading operation after completing the boring and facing operations. The design, therefore, is such that the boring, facing and threading operations can be finished complete at the one chucking, avoiding any imperfections, and saving the labor of transferring the work and re-chucking in another machine.

Simplicity of design, rigidity of construction, and accuracy of workmanship are features of the machine.



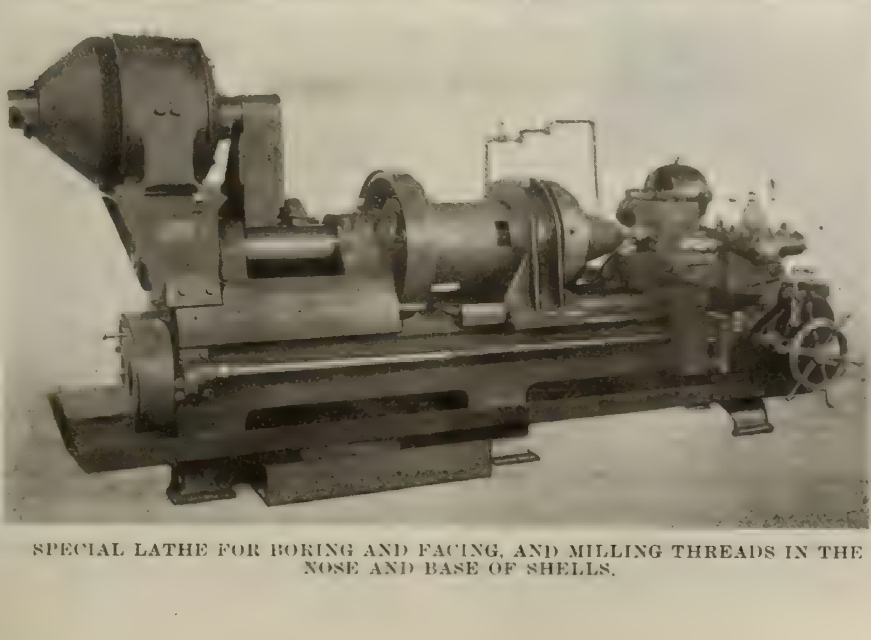
PNEUMATIC ROPE HOIST WITH MAXIMUM PULL OF 600 LBS.

The collet chuck is supported at its outer end by a heavy steady rest, and is driven direct from a spiral pinion on the back gear shaft engaging with a spiral gear secured to the collet chuck flange, which in turn is secured to the ends of the spindle nose. The spindle is 6¼ in. bore, and has large bearings provided with bronze bushings and the end thrust of the spindle is taken by a ball bearing against the rear housing. The drive from motor to back gear shaft is through a silent chain.

Special back gearing through worm and worm wheel is provided for reducing the speed of the spindle to the proper speed for milling the thread at one revolution of the spindle. Either the slow speed for milling or the regular speed for boring and turning can be instantly obtained by shifting of headstock lever. Change gears are provided, so that the relative speed between the boring speed and the milling speed can be varied to suit conditions. Three rates of quick change feeds are provided at headstock end of machine, and also the usual change gears for obtaining various feeds and for threads required for the screw cutting operation. The power feed for boring operation is through rack and pinion in apron mechanism, and interlocking mechanism is provided to prevent the engagement of the rack feed and the screw cutting feed at the same time.

The tool post is of cast steel and is mounted on the front of the cross slide. It is provided with four holes, 2¾ in. bore, for carrying suitable boring bars holding either single or double-ended cutters. Index pin on cross slide insures accurate lining up of the tool post holes with the headstock spindle when it is desired to use double-ended boring cutters.

The thread milling attachment is mounted on rear of the cross slide, and is provided with radial adjustment for aligning the spindle of the thread milling attachment with the lathe spindle. The thread milling spindle is mounted in adjustable bronze taper bearings, and has thrust washers and adjusting collar for preventing backlash of the spindle. The spindle is driven by worm and worm wheel and spiral gears from small motor mounted directly on the cross slide. Spindle is fitted with arbor for hob. The front end of cross feed screw is provided with an adjustable cam for accurately feeding in the hob to the correct depth of thread before the main spindle starts to revolve.



SPECIAL LATHE FOR BORING AND FACING, AND MILLING THREADS IN THE NOSE AND BASE OF SHELLS.

NEW MODEL LITTLE TUGGER HOIST

FOR the use of those who prefer Manila rope to wire rope for light hoisting and hauling, the Ingersoll-Rand Company, New York, has brought out a new model little tugger hoist, which is designated No. 11.

The square piston, reversible driving engine, automatic lubrication, enclosed gearing, drum release clutch and worm operated band brake, are essentially the same as in the No. 1 model, which was described on page 265 of this journal, September 17, 1914. The main differences are in the diameter and length of the drum, the width of the flanges, and, necessarily, the main frame and overall dimensions.

The new No. 11 Little Tugger has a hoisting drum 7 inches in diameter x 17 inches long, with 5-inch flanges. This accommodates 300 feet of ⅞-inch Manila rope. The maximum capacity of this hoist is conservatively rated at 600 pounds. The weight of the hoist itself is 358 pounds. It is 21½ inches long, 31¼ inches wide and 23 inches high.

Like the No. 1 model, this apparatus is built for operation both by compressed air and steam. The standard clamp fits a 4½ in. diameter column or pipe, but by removing the clamp the hoist can be readily bolted directly to any convenient support, timber, flooring, etc. Although designed primarily for underground work, it is suitable for all around hoisting, hauling and handling in mines, tunnels, quarries and industrial plants.

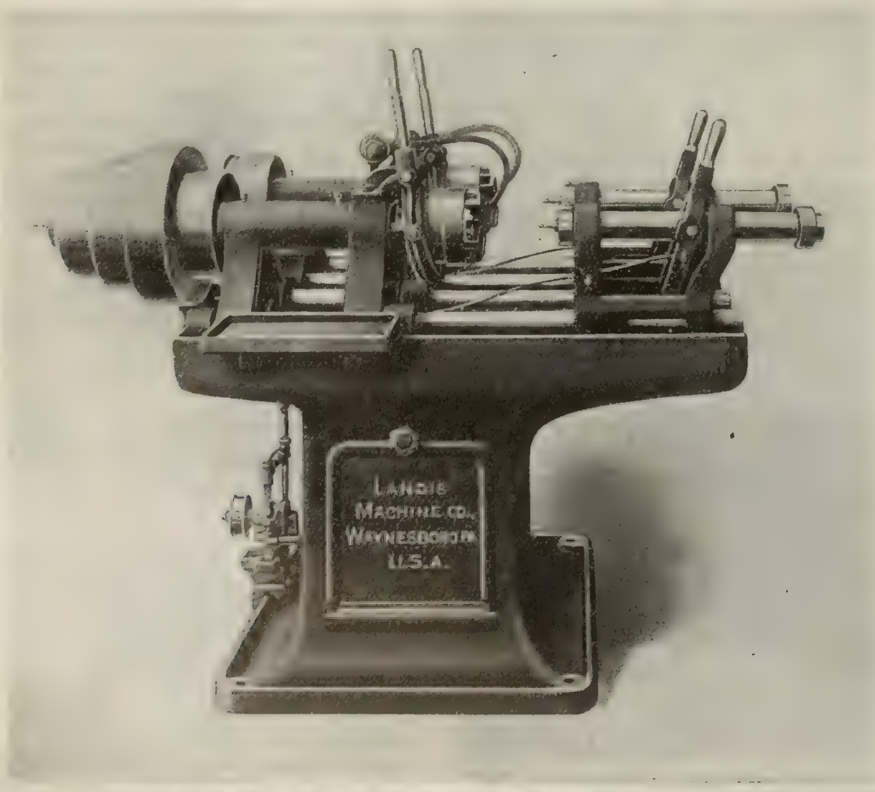
THREADING MACHINE FOR HOLLOW SET SCREWS

A THREADING machine, equipped with special carriages for threading hollow safety set screws, has been recently placed on the market by the Landis Machine Co., Waynesboro, Pa., which, while primarily designed to thread hollow safety set screws, may be employed in threading stock where there is a continuous thread and a similar method of holding. The carriages proper are stationary, and support two spindles which have a free horizontal movement. These spindles are brought to the threading die-heads by means of weights, which are attached by chains to the levers operating the spindles. These weights exercise a continuous force upon the spindles in the direction of the die-heads, making it unnecessary for the operator to advance the stock for the threading operation.

The heads of the spindles are bored and fitted with mandrels for holding the set screws. A collar is placed on the rear of each spindle, making it adjustable for cutting any desired length of thread. For the threading operation the set screw is placed upon the mandrel and the spindle automatically forces it into the die head. When the screw is threaded, it remains in a tube, which extends through the spindle from the face of the threading die-head to the rear of the machine. The subsequent threading of screws forces the finished pieces through the tube, where they drop into a receptacle placed at the rear of the machine.

These machines may also be used for threading standard bolts by attaching automatic opening and closing attachments for the die-heads. When standard bolts are threaded, the heads of the spindles on the carriages are fitted with bolt sockets for the various diameters within the range of the machine. These machines are equipped with Landis all-steel die-heads, which employ long-life chasers.



THREADING MACHINE FOR HOLLOW SAFETY SET SCREWS.

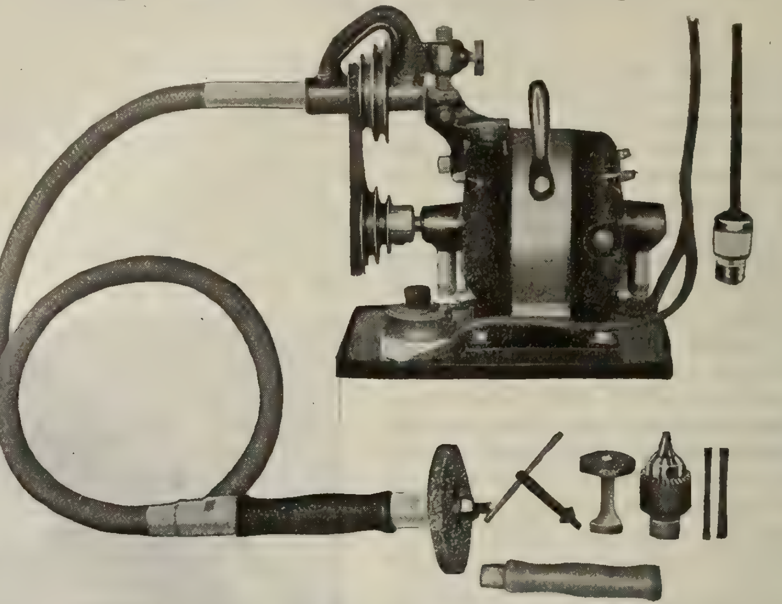


FIG. 1. FLEXIBLE SHAFT OUTFIT FOR LIGHT GRINDING, POLISHING AND DRILLING.

◆

FLEXIBLE SHAFT EQUIPMENT

THE economies to be effected by the use of flexible shafting on suitable work are now so widely recognized that its position as a standard item of machine shop equipment is thoroughly assured. Recent improvements in their product characterize the Strand Flexible Shaft, which is marketed by R. E. T. Pringle, Toronto.

Two types of this apparatus are illustrated, Fig. 1 showing an outfit for light grinding, polishing or drilling. It is built with either a 1-10 or a ¼ horsepower motor, which drives a 4 in. x ⅜ in. and 5 in. x ½ in. wheel respectively, the former weighing 60 lbs. and the latter 75 lbs. A three-speed countershaft is incorporated in the design, the one-piece leather belt acting as a safety drive to prevent overloading of the motor. By removing the detachable handle and wheel, the drill chuck can be attached in a convenient manner.

A similar equipment, designed for use in tool posts of various machines, is shown in Fig. 2. This outfit is also arranged to give change of speed for different size grinding wheels, and is adapted for internal as well as external grinding. Two sizes of this equipment are offered. The smaller has a ¼ horse-power motor driving a 7-16 in. shaft at 3,500-5,000-6,000 revs. per min., external work being done with a 6 in. x ½ in. wheel, and internal work with a 1 in. x ¼ in. wheel, the outfit weighing 75 lbs. The larger size has a ½ horse-power motor driving ½ in. shaft at 900-1,800-3,600 revs. per min., with wheels 8 in. x ¾ in. and 2 in. x ⅜ in. for external and internal work respectively. The sleeve which is held in the tool post is adjustable for different depths, and in the case of the larger outfit it is possible to grind the full depth of an 8 in. cylinder with a diameter as small as 2 in. For lesser diameters the small internal attachment is provided.

All shafts supplied with these outfits are made with an improved metal casing, which eliminates much of the trouble usually experienced with flexible shafts. It is so constructed as to be freely flexible to a certain radius, where it automatically forms a stop, thus preventing accidental short bends.

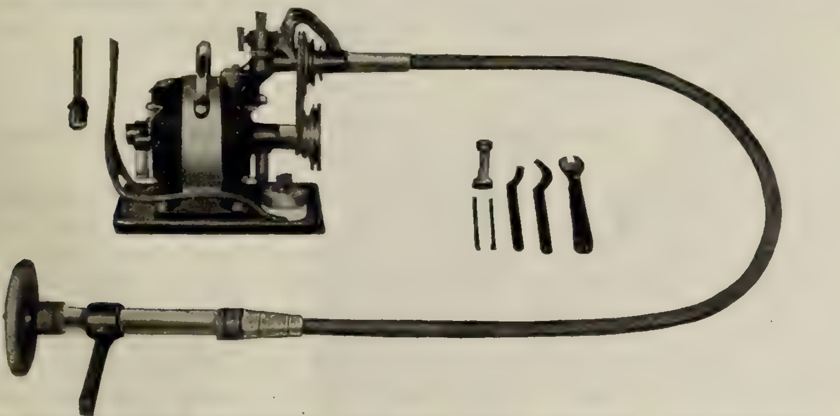

FIG. 2. MOTOR-DRIVEN TOOL POST EQUIPMENT FOR INTERNAL AND EXTERNAL GRINDING.

DAVIE SHIPBUILDING CO. CHANGES

GEO. D. DAVIE, president, and Thomas Robb and D. W. Ogilvie, directors of the Davie Shipbuilding & Repairing Co., Levis, Quebec, resigned from the board of that company at a meeting held in Montreal on October 20, as a result of financial changes that have placed new interests in control of the company. The only remaining member of the board is C. A. Barnard, of the Montreal law firm of Barnard, McKeown & Choquette, and he is at present on the other side, having sailed for England in company with Canada Steamship officials last week.

Geo. D. Davie, the retiring president, has been associated with the company since its inception a number of years ago under the name of the Geo. Davie & Sons Co., and, following the reorganization of three years ago, when the company assumed its present form and name, he became president. It is understood that Mr. Davie continues to own most of the mortgages outstanding.

The company is one of the oldest shipbuilding concerns on the St. Lawrence, and is the largest in Canada, with the exception of Canadian Vickers, Ltd., Montreal. Its greatest achievement is the boat now under construction for the British Columbia Government, which is nearly 400 feet long.

◆

RECOVERING TIN FROM SCRAP

INCREASED efforts toward the recovery of various metals are being made as a result of prevailing high prices. Copper, tin and brass are amongst the principal non-ferrous metals now receiving close attention, tin being of especial interest to metal users on this continent because of the fact that the supply has to be almost all imported from foreign sources.

The recovery process used in a large American tinplate works consists of three stages. Tin scrap is first "leached" in large vats by a 20 per cent. solution of stannic chloride, containing about 0.5 per cent. hydrochloric acid, the latter being to prevent formation of xides and oxy-chlorides of tin. Working at 150 deg. F., the leaching process occupies from 3 to 20 minutes, according to the condition of the solution. When the latter is saturated with tin—that is, completely converted to stannous chloride, it is pumped into small electrolyzing vats and electrolyzed at 5 volts, using a current density of 30 amps. per sq. ft., with two graphite plates as anodes and removable iron rods as cathodes. Electrolysis is continued till the liquor is again converted to stannous chloride, when it is ready for leaching a fresh batch of scrap. Tin is deposited on the cathodes in very fine crystals, which are scraped off the iron rods at intervals.

The final operation is to reduce the tin crystals to pig, and this is difficult, owing to their fineness and the ease with which they become oxidized. An electric furnace is found the only really satisfactory type, and the one actually used is of the shaft pattern, resembling a miniature blast furnace and standing about 3 ft. high. Once the fluxing slag is melted, the furnace is worked on the resistance principle, wet tin crystals mixed with carbon being fed in at the top of the furnace. The top of the latter is quite cool and, air being excluded from the furnace, there are no oxidation troubles. High quality pig tin is run off from the bottom of the furnace, and up to one ton of crystals can be melted daily.

◆

GRAND TRUNK RAILWAY SYSTEM ANNIVERSARY

THE Grand Trunk Railway management celebrated last week-end in Montreal the sixtieth anniversary of the inauguration of the inter-city communication between Toronto and Montreal. On November 27, 1856, the first train which joined the cities along the St. Lawrence waterway pulled into Montreal after a journey of 14 hours. The train itself was the last word in railway equipment of that date. The advancement of equipment and operation is shown in the fact that the distance is now covered in seven and one-half hours, or very nearly half of what it took sixty years ago.

In 1852 the Grand Trunk was incorporated to build a railroad between these two cities, and the first section of 125 miles to Brockville was open November, 1855. The following year the section from Brockville to Toronto was operated. In that year the pioneers of the road were proud that they had 849 miles of railroad, while they now have 8,115.

DETENTION EXTRAORDINARY

AFTER excusing itself for indulging in such frivolity, an exchange tells the story of a salesman who bought the only remaining sleeping car space. An elderly lady next to him in line in front of the ticket window burst into tears.

"I must have a berth in that train!" she exclaimed; "it's a matter of life or death!"

The salesman gallantly sold his reservation to her.

Next morning the salesman's wife was astonished to receive the following telegram from him:

"Will not arrive until to-morrow. Gave birth to an old lady last night."

GENERAL BUSINESS, SHIPPING AND SHIPBUILDING

NOT the least important feature of the prevailing prosperity in Canada is the marked improvement in the financial condition of many of our manufacturing establishments, large and small, particularly those engaged upon war orders. These concerns have been able to liquidate their liabilities and in many cases are accumulating substantial reserves. What is true in the sphere of general manufacturing is equally so as regards our shipbuilders and shipping corporations. Shipbuilding is booming as never before in our history, at least relative to steel construction, and as regards wood construction the present activity compares very favorably with past achievement. In the realm of shipping even more satisfactory returns are perhaps being realized, due to the dual circumstance that both lake and ocean transportation conspire to that end as compared with the former only in pre-war days. Vessel shortage for ocean service is all the time becoming more acute, and each day, so to speak, finds Canada's pre-war capacity for vessel production, turning down thousands of tons of building orders. Surely the time has arrived for our Government to interest itself to the point of action in fostering the establishment of greater and more widespread enterprise in shipbuilding, realizing as they cannot fail to do from the happenings of the past two years, that whatever other conditions may prevail when peace is declared, shipbuilding on a gigantic scale will claim precedence and be maintained at high pressure for probably a decade thereafter. Is the pressure being applied to Ottawa as powerful as is available and cannot the issue be forced to a successful conclusion? Additional, and the necessary pressure is, we believe, available to force a successful issue.

ENEMY SAMPLES EXHIBITION

WHILE the British Board of Trade and Sir George Foster, Canadian Minister of Trade and Commerce, who was instrumental in having the exhibit of enemy samples brought to Canada, deserve credit for giving our manufacturers an opportunity of inspecting certain lines of German goods that have been sold in numerous markets of the world, the commercial value of the undertaking as we see it is a doubtful quantity. The exhibit is interesting in that it reveals the technical and practical ability of the German artisans to utilize raw materials to the fullest possible advantage as well as their aptitude for supplying the special kind of articles which certain markets call for. In this respect the exhibit is an object lesson. As far as Canada is concerned, however, it looks as if little thought had been given to conditions which prevail within her borders.

It would, we think, be practically impossible to manufacture ninety-five per cent. of the articles in Canada because the production cost is prohibitive; there is therefore precluded the possibility of competing in markets where these cheap goods have been sold. The cost in Canada of raw materials alone, even in normal times, is such that the class of goods shown could not be produced profitably at a competing price. It has to be remembered that the standard of living in Germany is considerably lower than in Canada, wages being correspondingly on a much lower scale, reducing thereby manufacturing cost. Germany in normal times has direct steamer connections with the markets represented by her wares, which we have not, and cannot have until we have our own merchant marine, or at least until reciprocal trade within the Empire, at least, has developed considerably more than at present.

As an initial effort, put forth with the best intentions and anticipatory of more or less satisfactory results, we may not be too critical. To those concerned, the present exhibit in the matter of the interest displayed—aside altogether from ultimate results, should be an inspiration to further development, and that along the lines of not only a better class enemy goods exhibit as regards value, but relative also to such basic industries as agriculture, mining, mechanical and electrical engineering and allied spheres.

* * *

COST AND VALUE OF TRADE AND TECHNICAL PAPERS

ONE effect of munitions manufacture by Canadian metal-working plants that daily comes under our notice is the intelligent interest being taken by operators—yes, and by executives, in the outputs of kindred establishments, and the methods, devices and scheduled routine by which specific results are being achieved. In no direction is the interest more apparent than in that relating to the subscription personnel—numerical and otherwise of this journal. A higher cost of knowledge of one's trade or profession has, like the high cost of living, thrust itself to the front, due of course like the latter to a combination of circumstances, avoidable and perhaps not.

Sources of knowledge are not circumscribed, neither are its demands, in consequence centralization of the former for distribution becomes necessary, and printer's ink and paper are the mediums of accomplishment. Each of these commodities has been caught in the swirl of the universally prevailing abnormally high prices, cost of knowledge distribution having in consequence to follow suit. Whether in pre-war days the low cost at which up-to-date information in a trade and technical journal was assessed at its true value, by subscribers or otherwise, has become of little moment, because of the greater appreciation, due to the enlarged outlook, now being displayed; the relatively determining evidence being that of the alertness with which increased subscription rates have been responded to by those concerned. The cost of developing one's intelligence and aptness to pursue successfully a chosen trade or business career is still well removed from such a classification as "high."

INDUSTRIAL NOTABILITIES

JAMES THOMAS CUMMING, managing director, J. W. Cumming & Son, Ltd., manufacturers of coal drills, machines, tools and mine cars, New Glasgow, N.S., was born at Thorburn, N.S., June 1, 1887, son of John William and Catharine (MacIntosh) Cumming. He was educated at New Glasgow High School. The present business established by the above John William Cumming, May, 1902, grew rapidly until fifty-seven men were employed and many of the coal drills, mining machines, etc., used in the coal mines of the Maritime Provinces were being supplied. Upon the death of his father, the subject of our sketch, took over the business. A large market has been secured in Western Canada; the firm having well-established connections at Vancouver and various other points in the West, as also a warehouse and office at Lethbridge, Alta. The business was incorporated in 1911.

JAMES THOMAS CUMMING.

Mr. Cumming is a member, New Glasgow Town Council, and a Commissioner, New Glasgow School Board. He married Jean May Burns, daughter of Capt. W. W. Burns, of Norton, N.B., June 17, 1913, and has one daughter. His clubs are: Scotia; New Glasgow, and Royal Cape Breton Yacht (Sydney); and his societies: A.F.&A.M.; L.O.L. His recreations are fishing and shooting In politics Mr. Cumming is Liberal-Conservative, and in religion Presbyterian. His residence is at New Glasgow, N.S.

The General Market Conditions and Tendencies

This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents.

Montreal, Que., Oct. 30, 1916.—The strength of the steel market and the continual advance of prices is still the feature of the industrial situation, developments taking place on such a scale that the near future at least is practically in obscurity as far as definite prediction is concerned. The labor situation is still causing anxiety, but is not quite so acute as a few weeks ago.

Pig Iron

Record activity is taking place in the pig iron market, the situation being again featured by a general advance in practically every line of basic and foundry iron. The advance ranges from 50 cents per ton on foundry to $3 on Bessemer and low phosphorus pig.

Steel

That the existing condition in the steel market will be maintained throughout the entire year of 1917 is now taken for granted. The demand is so enormous that present production facilities are totally inadequate. Price is a secondary consideration to that of getting orders booked for definite delivery. Under these circumstances, it is more than likely that further advances may be expected. Pittsburg quotations on forging billets have advanced $5 per ton. Railroad activity is developing, and fair-sized orders are also being placed by coal and lumber interests more especially for light-weight rails. An insistent demand continues for all kinds of plates; shipbuilding and car requirements being the most active. Iron and steel bars have been advanced $2 per ton, the Pittsburg quotation being now $2.85; and $2.70 respectively.

Activity in sheets is very pronounced at present, increased interest having developed recently in galvanized sheets. which have been advanced $5 per ton, the base price being now $5 per hundred. Blue annealed is $3.30, an advance on the week of $1 per ton. In addition to the advance noted in wire products last week, an advance of $5 is reported this week on wire rods, Pittsburg, the base price being now $65 per ton. This is largely due to the marked scarcity in this class of material.

Wrought iron pipe and boiler tubes are very active, the base price of cold-rolled steel strip showing an advance of ¼c per pound, and being now 6¾c. The local situation is practically unchanged. although dealers here are contemplating an advance on some lines. Some slight changes are noted in sheets. Queen's Head is now $7.75; Fleur-de-Lis, $7.45, and Gorbal's Best, $7.75.

The situation in high-speed steel is not so acute as a few months back, the increased facilities for production having placed the producers in a position where they can supply the entire demands of the consumer. Owing, however, to the high cost of all raw materials, little relief has been shown in regard to price of the commercial article. One of the factors that has much bearing on present conditions is that the total amount of the orders placed at the present time by large consumers is comparatively small relative to those placed about a year ago. This is due to the fact that users do not wish to be overstocked, in event of any sudden cessation of hostilities. Some users are buying regular shipments of steel, sufficient for immediate needs, weekly shipments being subject to cancellation on two weeks' notice. The price of high-speed steel at the present time ranges from $2.50 to $3 per pound.

Metals

The metal situation has not been marked by any important features during the week, although the general conditions are somewhat disturbed by the political situation in the States. Copper is quiet and firm, with further buying imminent. Tin is irregular, but firm. Spelter is quiet after recent activity. Lead is steady, but with an easier tendency. Antimony is quiet, but firm. Aluminum is easier.

Copper.—The market continues to retain a very strong position, and, while quiet at present, an undertone of early activity is apparent. Reports are current of probable developments for additional export business, but delivery must necessarily extend well into next year, owing to the pressure already placed upon smelters and refineries. The abnormal consumption is almost entirely due to munitions demand, but it is anticipated that the requirements for domestic purposes, which are expected to be exceptionally heavy, following the close of the war, will be of such a volume that, although a decline will naturally result, the market will retain a high level for some years to come. The London report shows copper in a strong position and slightly higher. New York is very firm, with quotations unchanged. The local market is steady, prices being firm at 31c and 30c per pound.

Tin.—The irregular condition of the market has caused a little fluctuation in price quotations during the past week. The apparent accumulation of stocks on the American market has caused the British authorities to become reluctant in regard to shipping permits. This has had the effect of disturbing conditions in these markets. Prompt demand is comparatively quiet, with futures showing more activity. London quotations have advanced on a strong market, while present prices on the New York market are ⅞c higher than last week, the current quotation being 41⅞c per pound. Local dealers report a steady market, with prices firm and unchanged at 45c per pound.

Spelter.—With galvanizers taking increased interest in the spelter situation, the market has been more active. The demand, however, has again quietened down, and it is the general opinion that nothing of importance will develop while the American situation is awaiting the result of the Presidential election, not that the present market can be much affected by the event. It seems, however, an ingrained trait that industrial conditions should be unsettled under the circumstances. London is strong and firm, and New York is ½c higher than last week, the quotation being now nominally 10⅜c per pound. The local market is steady and fairly active, with prices firm and unchanged, the nominal quotation being 13c per pound.

Lead.—The market is quiet, but recent activity has maintained this metal in a steady position. Recent Canadian demands have been fairly heavy, owing to munition requirements. The easing up of the demand has placed producers in a position to offer fair-sized lots for early delivery. General conditions are, however, unchanged and quotations on all markets are firm. New York quotes 7c and 7⅛c, and local dealers are quoting 9c on a strong market.

Antimony.—The market is quiet after the short period of brisk buying. Inquiries are light, but the situation is firm. Quotations are steady, both on the New York and local markets, the former being 13¼c; dealers here are quoting 15c.

Aluminum.—The situation has again resumed the position held a few weeks ago, a decline of 1c during the past week putting the New York quotation at 65c for No. 1 Virgin and 60c for pure remelt. Local dealers are quoting 69c, a decline of 1c over last week.

Machine Tools and Supplies

With the demand for shell-making equipment gradually decreasing, the pressure on machine tool builders is becoming much lighter, and conditions are assuming more normal proportions. The market, however, is still quite active, as a brisk business is still being maintained in single and small lot requirements. Inquiries for special machinery is still active, but actual demand is not heavy. Owing to the continual advance in steel prices, the quotations on many lines of small tools and shop supplies have been advanced.

CANADIAN GOVERNMENT PURCHASING COMMISSION

The following gentlemen constitute the Commission appointed to make all purchases under the Dominion $100,000,000 war appropriation:—George F. Galt, Winnipeg; Hormidas Laporte, Montreal; A. E. Kemp, Toronto. Thomas Hilliard is secretary, and the Commission headquarters are at Ottawa.

Scrap

Following the activity of the past few weeks, the scrap market at present is comparatively quiet. A steady demand is prevalent for old copper, and high prices are still maintained. Scrap zinc is fairly active, as is heavy melting steel scrap. Prices are invariably firm, with heavy melting steel showing an advance of ½c, the local price being now 10c per pound.

Toronto, Ont., Oct. 31.—Trade continues active and the country is remarkably prosperous. The full benefit however is not being obtained owing to somewhat restricted production due to scarcity of raw materials and shortage of labour. Prices are also very high, but this does not seem to be affecting the volume of busuiness to any marked degree. The demand for goods generally is not being fully met owing to the difficulty that is being experienced in obtaining deliveries from manufacturers. Export trade is steadily growing and is extending in scope as more industries develop their sphere of action. The Dominion Government returns up to the end of last month prove conclusively the remarkable expansion that has taken place in the export during the past twelve months. For the month of September alone, manufactures headed the list, being valued at thirty-eight million dollars as against nine million for the corresponding month of 1915. The statement recently issued covering the period mentioned is extremely gratifying.

Steel.

The situation in the trade is getting tighter all the time and the scarcity of steel is steadily getting more acute. With a large proportion of the production of the mills reserved for munitions, a comparatively small tonnage is available for other purposes. The mills have been some time operating at capacity, and, notwithstanding extensive additions to their plants, deliveries are getting more backward than ever. The demand for steel is so insistent and the need so urgent that the steel companies are doing their best to cope with the situation, but cannot, and the situation is thus getting steadily worse. Indications point to a continuance of these conditions for an indefinite period as the mills are now sold up for practically twelve months. Prices are still withdrawn and orders are only taken on the understanding that delivery will be made at mill convenience. Prices on steel bars are entirely nominal and an advance may be looked for any time. Owing to the scarcity of steel some consumers are substituting iron bars for steel in order to secure deliveries. For domestic business, practically the only orders being taken by the mills are with contract customers of long standing and with no delivery dates specified. Small angles, channels and tees have advanced 10c and are now quoted at $3.85 per 100 pounds. Plates have advanced 25c and are now quoted at $4.75 for ¼ in. and larger, $5.00 for tank plates 3-16 in. and smaller. These prices are however for delivery at mill convenience which would not be inside twelve months. For delivery in from two to four months' prices range around 5c at mill. A considerable tonnage of plates is being used by shipbuilders and premiums are being paid for comparatively quick delivery.

Enlarged Canadian Trade Intelligence Service

Under the arrangement made by the Minister of Trade and Commerce with Sir Edward Grey in July, 1912, the Department of Trade and Commerce, Ottawa, is able to present the following list of the more important British Consulates whose officers have been instructed by the Foreign Office to answer inquiries from and give information to Canadians who wish to consult them in reference to trade matters.

BRAZIL

Bahia, British Consul.
Rio de Janeiro, British Consul General.

CHILE

Valparaiso, British Consul General.

COLOMBIA

Bagota, British Consul General.

ECUADOR

Quito, British Consul General.
Guayquil, British Consul.

EGYPT

Alexandria, British Consul General.

FRANCE

Havre, British Consul General.
Marseilles, British Consul General.

INDIA

Calcutta, Director General of Commercial Intelligence.

ITALY

Genoa, British Consul General.
Milan, British Consul.

MEXICO

Mexico, British Consul General.

NETHERLANDS

Amsterdam, British Consul.

PANAMA

Colon, British Consul.
Panama, British Vice-Consul.

PERU

Lima, British Vice-Consul.

PORTUGAL

Lisbon, British Consul.

RUSSIA

Moscow, British Consul General.
Petrograd, British Consul.
Vladivostock, British Consul.
Odessa, British Consul General.

SPAIN

Barcelona, British Consul General.
Madrid, British Consul.

SWEDEN

Stockholm, British Consul.

SWITZERLAND

Geneva, British Consul.

URUGUAY

Monte Video, British Vice-Consul.

VENEZUELA

Caracas, British Vice-Consul.

CANADIAN COMMERCIAL INTELLIGENCE SERVICE

The Department of Trade and Commerce invites correspondence from Canadian exporters or importers upon all trade matters. Canadian Trade Commissioners and Commercial Agents should be kept supplied with catalogues, price lists, discount rates, etc., and the names and addresses of trade representatives by Canadian exporters. Catalogues should state whether prices are at factory point, f.o.b. at port of shipment, or, which is preferable, c.i.f. at foreign port.

CANADIAN TRADE COMMISSIONERS.

ARGENTINE REPUBLIC

H. R. Poussette, Reconquista, No. 46, Buenos Aires. Cable address, Canadian.

AUSTRALIA

D. H. Ross, Stock Exchange Building, Melbourne. Cable address. Canadian.

BRITISH WEST INDIES

E. H. S. Flood, Bridgetown, Barbadoes, agent also for the Bermudas and British Guiana. Cable address, Canadian.

CHINA

J. W. Ross, 13 Nanking Road, Shanghai. Cable address, Cancoma.

CUBA

Acting Trade Commissioner, Lonja del Comercio, Apartado 1290, Havana. Cable address, Cantracom.

FRANCE

Phillipe Roy, Commissioner General, 17 and 19 Boulevard des Capucines, Paris. Cable address, Stadacona.

JAPAN

G. B. Johnson, P. O. Box 109, Yokohoma. Cable address, Canadian.

HOLLAND

Acting Trade Commissioner, Zuidblaak, 26, Rotterdam. Cable address, Watermill.

RUSSIA

C. F. Just, Canadian Government Commercial Agent, Alexandrivskaya, Ploshch 9, Petrograd.
L. D. Wilgress, Canadian Government Commercial Agent, Bukhgolza Ulitza No. 4, Omsk, Siberia.

NEWFOUNDLAND

W. B. Nicholson, Bank of Montreal Building, Water Street, St. John's. Cable address, Canadian.

NEW ZEALAND

W. A. Beddoe, Union Buildings, Customs Street, Auckland. Cable address, Canadian.

SOUTH AFRICA

W. J. Egan, Norwich Union Buildings, Cape Town. Cable address, Cantracom.

UNITED KINGDOM

Harrison Watson, 73 Basinghall Street, London, E.C., England. Cable address, Sleighing, London.

N. D. Johnston, Sun Building, Clare Street, Bristol. Cable address, Canadian.

J. E. Ray, Central House, Birmingham. Cable address, Canadian.

J. Forsyth Smith, 27-28 Pearl Building, East Parade, Leeds. Cable address, Canadian.

F. A. C. Bickerdike, Canada Chambers, 36 Spring Gardens, Manchester. Cable address, Cantracom.

J. T. Lithgow, 87 Union Street, Glasgow, Scotland. Cable address, Contracom.

SPECIAL TRADE COMMISSIONER—LUMBER

H. R. McMillan, visiting Europe, Africa, Australasia and the Orient.

CANADIAN COMMERCIAL AGENTS

AUSTRALIA, B. Millin, Sydney, N.S.W.

BRITISH WEST INDIES

Edgar Tripp, Port of Spain, Trinidad. Cable address, Canadian.
R. H. Curry, Nassau, Bahamas.

NORWAY AND DENMARK.

C. E. Sontum, Grubbegd No. 4, Christiania, Norway. Cable address, Sontums.

CANADIAN HIGH COMMISSIONER'S OFFICE

UNITED KINGDOM

W. L. Griffith, Secretary, 17 Victoria Street, London, S.W., England.
Cable address, Dominion, London.

Tubes are very firm, and higher prices are looked for, while an advance in wrought pipe is expected in the near future due to the recent advance in skelp, this material being also very scarce. Higher prices on bolts, rivets and pressed spikes are also anticipated.

Black sheets No. 28 gauge have advanced 25c, and are now quoted at $4.25 per 100 pounds, while an advance in "blue annealed" is probable. Sheet bars are now quoted at $50 Pittsburgh, and are getting scarce owing to the heavy demand. It is possible that a famine in steel sheets will exist during the first six months of next year so great is the scarcity of raw material. Higher prices on galvanized sheets are assured on account of the steady advance in black sheets and increase in cost of production.

An advance of nearly 100 per cent. in the price of coke has created a serious situation in the Pittsburgh district. The market continues very firm and prices of all steel products have an upward tendency. The export demand for steel is at a rate far in excess of the unsold capacity of the mills to accept and a lively competition is expected between export and domestic buyers which will result in higher prices. The U.S. Steel Corporation has announced advances in the leading tonnage materials for forward delivery, or to 2.70c for bars, 2.85c for shapes and 3.75c for plates. Higher prices on semi-finished steel have been announced representing an advance of $5 per ton. Bessemer and open-hearth billets are now quoted at $50, open-hearth sheet-bars $50, and forging billets $73.00 per ton, Pittsburgh. The scarcity of steel in the States is acute and higher prices are inevitable, notwithstanding the present record levels.

Pig Iron

Price of pig iron after several months of quietness are now advancing rapidly. This is due largely to the enormous demand for steel, but the sharp advance in coke and possible higher prices on iron ore next January are also affecting the situation. The activity in the U.S. pig iron market is also affecting the trade locally and the market is very strong. Domestic pig irons have advanced $2.50, Hamilton and Victoria being now quoteed at $29.00 per ton. Practically all brands of U.S. pig iron have advanced, the following prices now being quoted: Grey forge Pittsburgh, $20.95, and Bessemer, Pittsburgh $24.95.

Scrap

The market is very firm all along the line and advances have to be noted in some grades of scrap copper, affecting crucible, heavy, copper wire, and machine composition. Heavy melting steel continues in good demand with a shortage of supplies. Steel turnings are in good supply, but there is very little market for this material.

Machine Tools

The machine tool market has been more active this week following the placing of further contracts for shells and fuses. For making the latter, a number of orders have been received by a local machinery house for screw machines, high speed bench drills, and bench milling machines. Inquiries have also been received for machine tools for shrapnel plants. Tool room equipment is in good demand but deliveries on this class of tools are slow and restricting business. There is still a steady demand for heavy duty lathes, in many cases for single tools. Prices on machine tools generally are still very high and there is no sign of a decline. Shapers, grinders and milling machines will probably advance. Canadian machine tool builders are still very busy. New types of tools for shell plants are continually being placed on the market with satisfactory results.

"CANADIAN MACHINERY" IN ENGLAND

Permit me to compliment you on your publication. Two copies of the September 7 monthly Export issue have come to hand. The articles on the National Steel Car Co. plant, the Montreal Locomotive Shops, and the new C. P. R. Station at Quebec, are specially good, and ought to be of great interest to rolling stock people on this side. Additional copies would not be amiss here.—H. D. J., Bristol, England.

Supplies

The situation as regards machine shop supplies continues satisfactory, good business generally being reported. Prices are very firm and advances in many lines may be expected any time although there are no changes of particular importance to note this week. With raw materials, particularly steel, advancing at the present rate, many lines of supplies will naturally be affected such as taps, dies, cutters, files, etc.

Metals

The metal markets this week have been unusually steady with quotations generally well maintained. The situation locally continues favorable with a satisfactory volume of business. Copper although unchanged is still strong, largely due to an enquiry from Russia, France, and Italy for 100,000,000 pounds of metal for delivery during the next six months. Spelter is in fair demand, but tin and lead are dull and unchanged. Antimony is also dull, but aluminum is fairly active. The coming Presidental Election in the States is tending to keep the market quiet there.

Copper.—The market ontinues strong but quiet as domestic consumers appear to be covered for the rest of the year and producers are practically sold up until February. It is reported from New York, that Russia, France, and Italy are enquiring for 100,000,000 pounds of copper, but, as delivery cannot be made before February, the business may not be closed. Domestic buying is good and very little copper available for delivery over the next few months is unsold. Local prices are firm and unchanged, lake and electrolytic being quoted at 31c and casting at 30c per pound.

Tin.—The London market is easier but New York is unchanged. The New York market will probably become firmer as some difficulty is now being experienced in getting permits to ship tin from London owing to the heavy stocks in the U.S. The local situation is unchanged and quotations are firm at 46c per pound.

Spelter.—Producers appear to be looking for higher prices as they are not over anxious to do business. There is a fair demand for spelter principally from galvanizers, and export business continues heavy. Local price is firm at 14c per pound.

Lead.—There is no essential change in the situation, the market being dull and business quiet. The leading interest is still quoting 7c New York. Local quotation 9c per pound.

Antimony. — Quotations are nominal and the market quiet. Antimony is quoted at 18c per pound locally.

Aluminum. — Demand has shown slight improvement and the market is steady with quotations unchanged at 68c per pound.

◆

CANADA'S TRADE SHOWS HUGE INCREASE

THE total of Canadian trade, exclusive of coin and bullion, for the twelve months ending September 30 last, amounted to $1,738,204,256. This is an increase of $803,038,833 over the total for the corresponding twelve months of 1915, and of $737,140,757 in 1914. The total trade for the month of September amounted to $161,067,661, an increase of several millions over the trade for September, 1915, and of eighty millions over the same month in 1914.

The total imports of merchandise for twelve months ending September 30 last amounted to $685,278,605, an increase of 268 millions over that for the corresponding period of 1915, and of 154 millions over that for the 1914 period. Total imports for September amounted to $68,796,262, an increase of 30 millions, or nearly double that of September, 1915, and of 32 millions over September, 1914.

Duty Collected

The duty collected during the twelve months amounted to $129,610,574, an increase of 50 millions over that collected during the 1915 period, and of nearly 40 millions over the amount collected during the 1914 period. During September, $11,942,791 was collected, an increase of four millions over September, 1915, and of nearly six millions over September, 1914.

The total exports of merchandise amounted to $1,052,925,651 during the year, an increase of 535 millions over those for the 1915 period, and of nearly 600 millions over 1914. For the month, the exports totaled $92,271,399, an increase of nearly 40 millions over the total for September, 1915, and of 51 millions over that for 1914. During the twelve months, agricultural and animal products provided just about 50 per cent. of the Dominion's total exports.

Manufactures Higher

Manufactures provided about 33 per cent.; mining products came next with 7 per cent.; forestries with 5 per cent., and the fisheries with about 2½ per cent.

Some idea of the effect of the war may be gathered from the fact that while during the 1915 and 1914 periods the products of the farm provided about 40 per cent. of the exports, manufactures in the 1915 period provided only about 25 per cent., and in the 1914 period only about 14 per cent., as against a proportion of 33 per cent. in 1916.

In the total export trade for the twelve months ending in September, agricultural products headed the list with a total of $396,455,537, animal products totaling $111,331,332, while those of manufactures were $361,381,419. Exports of agricultural products trebled as compared with 1915 or 1914, while manufactures did the same as compared with 1915, and were nearly six times those for 1914.

For the month of September, manufactures led the exports with nearly 38 million dollars, as against only 9 millions for September, 1915, and 5 millions for the same month in 1914; agricultural products came next with 25 millions, as against 11 millions for 1915 and 7½ millions for 1914. Animal products provided 12 million dollars worth of exports, as against 10 for September, 1915, and 7 for September, 1914. Exports of the products of the forest were nearly a million less for September, 1916, than for September, 1915.

CANADIAN TRADE WITH FOREIGN COUNTRIES

CANADIANS still buy from the Germans. The war has not wholly severed Canada's trade with the enemy. Whether it be all-necessary dyes, medicines, chemicals, or goods that the Canadians could do without, the Canadian Government returns show that during the year ending March 31 last $86,304 worth of dutiable and "free" imports for consumption had been brought into Canada from Germany. Of this amount $41,126 were dutiable and $45,178 were free; that the figure of $86,304 represents goods shipped from Germany prior to the declaration of war, but which had not been entered at Customs until some time during the year ending March 31, 1915.

Under the caption, "Trade of Canada with Germany," the official report of the Department of Trade and Commerce gives some interesting figures regarding trade with the Empire's allies and enemies.

During the past decade Canada's trade with Germany steadily increased. Between the years 1912 and 1913 the total business transacted between Canada and Germany increased from $14,904,919 to $17,616,941. A year later, the year war was declared, Canadian-German trade, up to March 31, amounted to $19,019,959. But when war broke out trade did not cease. The official report points out that the results obtained from "Canadian Returns" show that the gross value of Canadian-German trade up to March, 1915, seven months after hostilities commenced, amounted to $7,248,996. Of this amount, $3,887,906 worth of dutiable goods were imported as well as $1,199,080 of "free" goods, making a gross value of German imports of $5,086,986.

Canadian Exports to, Germany

During the same period the Canadian exports to Germany were valued at $2,162,010, divided up as follows: Goods listed as "Canadian produce," $1,447,391, and $714,619 worth of foreign produce. While Canada still continued to import supplies from Germany after March 31, 1915, the returns state that Canadian exports to Germany ceased at that time.

The returns given by the Department of Trade and Commerce show that during the twelve months ending March 31 $394,077 worth of goods was sent to and brought from Belgium. The listed value of Canadian produce sent to Belgium is figured at $334,762.

Franco-Canadian Trade

Franco-Canadian trade during the year ending March 31 last was almost 100 per cent. greater than during the previous year. During the last fiscal year for which the figures are ascertainable, $42,035,224 worth of business was transacted between the two countries. Of this amount, $5,949,411 is stated as the value of the imports; the exports were valued at $36,085,813, a very acceptable balance of trade if the figures did not cover the war business, which cannot be taken into consideration when permanent trade relations of the two countries are taken into consideration.

Big Italian Trade

The returns cited in connection with the Italian-Canadian trade show the tremendous impetus given these relations by the war. For the year ending March 31, 1915, $3,313,709 worth of goods was interchanged by the two countries. During the following twelve months the gross value increased to $11,653,559. Of this amount only $920,271 covers the value of goods imported by Canada from Italy, while $10,733,288 represents the value of Canadian and foreign produce exported by Canada to Italy.

Canada still carries on a vigorous trade with Japan, although in this case there is an adverse balance. During the same fiscal year, as cited above, Canada sold $998,240 worth of goods to the Japanese, and bought $4,015,125 worth of goods from the Flowery Kingdom.

BRITAIN SHOULD SEEK OUR TRADE

SUGGESTIONS for improving Canada's trade with the other parts of the Empire and outside countries were made by F. C. T. O'Hara, Deputy Minister of Trade and Commerce, to the Dominions' Royal Commission on October 25, at Ottawa. Mr. O'Hara said British manufacturers did not get after the Canadian trade like the American manufacturers. "The goods won't sell themselves," he said, "and it needs some one to sell them."

Merchants in Canada could order their goods overnight from New York and often they had to procure English products in that way.

"With all due deference to energy and ability displayed by the present British Board of Trade Commissioners in Montreal," he continued, "I think Canada should be sub-divided into areas within which additional British commissioners should be appointed, reporting

Finish Bore, Inside Radius.

8" Shells

9.2" Shells

50% Boring Economy!

High-salaried men are employed to keep the cost of production down, but in this case a boy could see the advantages to be obtained through these boring heads.

25% to 50% reduction is obtained only by the use of Davis Boring Heads. These consist of 16 sizes and 26 different styles, and embrace every operation from a shell of the smallest calibre to 8" and 9.2". (The quality of work produced is limited, and that limit is highest quality.)

Davis Boring Heads are constructed of high-speed steel and are the result of scientific knowledge of boring-tool requirements and the experience obtained by the "pioneering" days.

WRITE FOR PARTICULARS.

The heads illustrated here are used for operations on 8" and 9.2" shells. The heads are all equipped with micrometer adjustments. This enables more speed to be put to the operation, leaving the adjusting of the cutters to the micrometer.

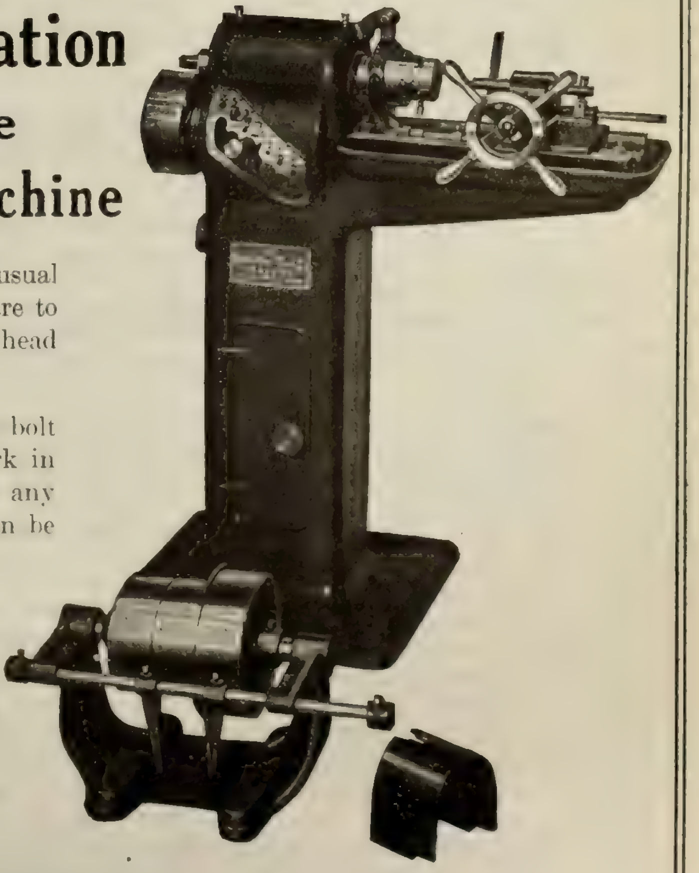
Rapid and Perfect Duplication

That is the Mission of the Geometric Threading Machine



From ⅛-in. pipe thread to 1-in. diameter is the usual range of the machine, but where fine pitch threads are to be cut on larger diameters, it can be fitted with a die head that will take care of the work.

The Geometric Threading Machine is not the usual bolt threader, but a machine for producing accurate work in quantity—work that cannot be done economically in any other way, and gives threads as true and clean as can be produced on any screw machine.

Get acquainted with the machine by sending for our Threading Machine Booklet.

The Geometric Tool Company

New Haven, Conn., U.S.A.

Canadian Agents: Williams & Wilson, Ltd., Montreal: The A. R. Williams Machinery Co., Ltd., Toronto, Winnipeg and St. John, N.B.

to and being directly responsible to the Board of Trade in London."

He suggested that such commissioners be appointed in Vancouver, Winnipeg, Toronto, Montreal and Halifax.

"The United States leaves nothing undone to secure Canadian trade. There are some hundred consuls of the United States here, and thousands, I might say millions, of advertising circulars are sent into this country every year. There are also the innumerable trade and other magazines which carry advertisements of American goods which all swell the trade."

The Deputy Minister of Trade and Commerce also recommended that the various overseas dominions have representatives in Canada.

Toy Exhibit Fruitful

The recent Canadian Government made-in-Canada toy exhibit at Toronto Exhibition greatly interested the Royal Commissioners. Both Sir George Foster and Mr. O'Hara said that it had done much good to interest manufacturers and give an impetus to trade. Hon. J. H. Sinclair, New Zealond, wanted to know if the showing of German goods did not advertise the latter, but Mr. O'Hara said the opposite was the fact. It gave Canadian makers fresh ideas.

R. H. Campbell, Dominion Director of Forestry, said in answer to questions that the supply of timber had not materially decreased here. When the high price of paper was mentioned, Mr. Campbell was asked if the cost of labor in pulp manufacture had gone up. He said it was not within his knowledge.

VALUE OF ENEMY SAMPLES EXHIBITION

THE registration for the first week of the Exhibition of Enemy Samples now being held in Toronto were approximately 1200, which included a large percentage of manufacturers. Herbert Kershaw, representing the British Board of Trade, who is in charge of the exhibits, expressed himself to a representative of CANADIAN MACHINERY as being highly gratified with the attendance and also with the interest shown in the various exhibits. Manufacturers from several industrial centres in Ontario and also local manufacturers have visited the exhibition. Many borrowed samples such as blankets, carpets, hardware, soaps, lamps, small tools, etc., to name a few, for closer examination at their factories, in some cases expressing a belief that such articles could be made in Canada.

Manufacturers visiting the exhibition realized the need for overseas markets and have shown deep interest in the possibility of selling Canadian goods in the markets as indicated on the samples. In this regard, the exhibition has served not only to inspire manufacturers to take up new lines but also to assist them in realizing the various classes of articles which have been sold extensively in remote parts of the world such as Africa, India, Asia, etc. A manufacturer who is sufficiently alert and imaginative also sees in a particular contrivance a peculiar form of mechanism which can be beneficially applied to his own lines of manufacture. It is here where a man with an inventive faculty can effectually combat his less fortunate rival.

The exhibition has doubtless stimulated a desire to learn more about foreign markets, the classes of goods most in demand, how they are sold, credits etc. It has also shown how the Commercial Intelligence Branch of the Department of Trade and Commerce can be utilized to assist in the development of trade with these countries. The Department has means of obtaining much valuable information which is placed at the disposal of any manufacturer requiring same. Another feature of the exhibition is the number of ideas that can be obtained by inspecting the samples and which can be applied in making other goods. The majority of the articles are admittedly cheap but many have embodied in their construction or design some feature which might be copied in the manufacture of similar or entirely different articles, depending of course on what any special idea might consist of.

While it is too early to determine what benefits may have occurred to Canadian industries, there is little doubt that the exhibition will stimulate a desire to develop export trade not necessarily in the class of goods exhibited, but in any product that might be possible to sell in any foreign market. The field is unlimited and the opportunity waiting. It is understood that at some future date an exhibition may be held of articles of German and Austrian manufacture which have been sold in the Canadian market. The exhibition at the Convention Hall will be open until November 6 inclusive.

HUDSON BAY ROUTE BENEFITS DOUBTED

WHAT benefits are to be derived by the Dominion as the result of the construction of the Hudson Bay Railway was the chief point dwelt upon by the members of the Dominions' Royal Commission at their afternoon sitting on Oct. 25, when it heard W. A. Bowden, chief engineer of construction work of the Department of Railways and Canals.

"The problem is more complex than any other I have had to deal with," the engineer stated, when asked what the benefits to be derived from this big expenditure would be. He outlined the advantages in that the distance from the grain centres to Port Nelson was the same as the distance from Winnipeg to Fort William. The distance from Port Nelson to Liverpool was the same as from Montreal to Liverpool. Accordingly in distance there was a saving by the Hudson Bay route equal to that from the head of the Great Lakes to Montreal. The cost of haulage over this distance is from five cents to twelve cents a bushel.

Initial Information Unreliable

"The information we had when we started the work has proven very unreliable during the five seasons we have been working. For example, our information was to the effect that the route through Hudson Bay would be open to navigation about the last of June or the first of July. The facts are that it is not open until the last of July or the first of August. The date when it closed was not fixed in that early information. However, ordinary tramp steamers have left Port Nelson on October 23, and have gone through without damage by ice. A Government tug went through on Nov. 1, but the ice would have damaged a tramp. By having observation points at the Straits to direct the boats to open water, it would be possible that the season could be lengthened past Oct. 23."

"Would the grain be harvested in time to be shipped this way?" Mr. Bowden was asked.

"For August the grain shipped would be that which had been left over from the year before. There is always some at the head of the Great Lakes now at that time. The new grain would come on in September, and could be shipped through the months of September and October."

"Before this great expenditure was undertaken," asked one of the Commissioners, "were any steps taken to insure steamship service when the road is completed?"

"No, I do not think there should have been," replied the engineer, "because such a service would have been based on the worst conditions that might arise and, therefore, at the maximum expense."

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News

Engineering

St. Catharines, Ont.—The St. Catharines Brass Works will build a foundry here.

St. Alexis, Que. — The Saguenay Light & Power Co., are building a power house here.

Winnipeg, Man.—The Manitoba Pulp & Paper Co., propose building a power plant at Grand Rapids.

Toronto, Ont.—The Taber Laundry Works will build an addition to their boiler room on Bathurst Street.

Toronto, Ont.—The Canadian Fairbanks-Morse Co. will build an extension to their plant on Bloor Street West.

Galt, Ont.—Plans are being prepared for a brick factory to cost about $50,000, for the Dodge Metal Hose Co. J. Evans, 30 Water Street, is the architect.

Sault Ste. Marie, Ont.—On October 24 the big coal unloading bridge at New Ontario Dock, valued at $50,000, was blown over in the gale and reduced to scrap.

St. John, N.B.—Tenders will shortly be called for the erection of a pumping station for the St. John Railway at St. John, N.B. G. G. Murdock, is the engineer.

Port Colborne, Ont. — The International Nickel Co., is getting prices on equipment for the refinery which will be built here. All buying will be done through the head office at 43 Exchange Place, New York.

Vancouver, B.C.—The Shell Oil Co. may establish a large refinery near here. A site has been acquired on Lulu Island, adjoining the Fraser River. W. M. Smith, president of the company, has been here looking over the ground.

St. Catharines, Ont.—Fire totally destroyed a frame structure, 225 by 50 feet, on section 2, Welland ship canal, erected and owned by Baldry, Yerburgh & Hutchinson, contractors, and used as engine house, machine shop, blacksmith shop, and storehouse. The machine shop was one of the best equipped on the canal. The loss will be in the neighborhood of $40,000, only partly covered by insurance.

Sarnia, Ont. — The Imperial Oil Company has secured a large tract of land at the south end of the city and will start construction of another refinery in the very near future, according to information secured to-day. The new plant will be separate from both No. 1 and No. 2 plants and will cost several hundred thousand dollars in initial outlay, and will be enlarged later. The land was secured sometime ago, and comprises two city blocks and the houses and other buildings will be wrecked to make way for construction.

Port Arthur, Ont.—By a vote of 1,200 to 40, the ratepayers of Port Arthur on October 24 ratified an agreement between the city and Annwell G. McIntyre, of Toronto and Montreal, by which the latter, representing interests which now have four pulp mills in Canada, will build another mill here. They plan a plant of 150 tons output per day in three units of fifty tons per day each, to which is to be added a paper mill. Under the agreement upon which pulp limits are secured from the Ontario Government, the 150-ton plant must be completed in three years, at a cost of $1,000,000. Construction is to be started immediately. The plant will be located at Bare Point, in the north end of the city. The municipality gives 100 acres of land, with no exemption from taxation or other bonus.

General Industrial

New Toronto, Ont.—The Dupont Fabrikoid Co. are building a factory here.

Niagara Falls, Ont.—The Nesbitt Billings Co. will build a factory here to cost $15,000.

Belleville, Ont.—The Maple Leaf Tires, Ltd., have commenced the erection of a large factory here.

Moose Jaw, Sask.—The Saskatchewan Clay Products Co., propose making extensive additions to their plant.

Teeswater, Ont.—The Orangeville Lime and Cement Co. has purchased the William Gordon farm and purpose erecting a plant, valued at $75,000, during the winter and coming summer. The Toronto Lime Co. is engaged in erecting kilns at present, on the property purchased from Mr. Watson.

Municipal

Grand Forks, B.C.—The Town Council propose extending the municipal power plant.

Hespeler, Ont.—The Town Council propose making extensions to the waterworks system.

St. John, N.B.—The City Council will shortly call for tenders on the supply of about 3,000 feet of 20-in. cast iron pipe.

Lethbridge, Alta.—A by-law was carried to authorize a payment of $17,000 for extensions to the electric light system.

Cornwall, Ont.—The Town Council propose building an extension to the pumping station and installing centrifugal pumps.

Bridgetown, Ont. — A by-law was passed by the City Council to raise $1,319 to pay for the cost of an ornamental lighting system.

Strathroy, Ont.—Dr. McCullough, of the Provincial Health Department, has ordered the installation of a chlorination plant for the water system here.

Fredericton, N.B.—The City Council has decided to purchase a motor-driven hose truck and a horse-drawn hook and ladder truck. The total cost will be about $8,000.

Bracebridge, Ont.—By-laws will be submitted to the ratepayers on Nov. 20 to guarantee bonds of the Beacon Match Co., to the extent of $15,000, and granting the company fixed assessment for ten years.

Winnipeg, Man.—Controller Astley proposes that a by-law should be prepared for the purpose of raising the sum of $275,000, to be expended on the erection of a part of a new city hall, to occupy the present location of what is known as the old city market.

Contracts Awarded

The Polson Iron Works, Toronto, have been awarded a contract for boilers by the Lincoln Paper Mills Merritton, Ont.

The Turnbull Elevator Mfg. Co., Toronto, have been awarded contracts for elevators by the Canadian Bag Co., Toronto and H. Greisman, Toronto.

EXPORT TO RUSSIA

Russia wants electrical goods, machinery of all kinds and plants, motor cars, bicycles and accessories, paints, varnishes, medical instruments, shipbuilding materials, railway materials, builders' hardware and material, many textile products, laces, fancy goods, haberdashery, cutlery, jewellery, glass and pottery, steel, aluminum, leather, tools, plumbing goods, pumps, chemicals, agricultural implements, canned goods, furniture, games and toys, household utensils, and hundreds of other products.

We have a way of putting your name and address, and pictures of your product before all Russian buyers —at very small expense—and will care for translations and tell you how to conduct Russian export business.

100 leading Canadian manufacturers have already taken entries in the

DIRECTORY OF BRITISH MANUFACTURERS FOR RUSSIAN TRADE

a classified reference book of British manufactures, printed in Russian and circulating in Russia (8,000). Purely British and recognized by Governmental authorities.

This announcement is printed so that manufacturers whom we have not already reached may inquire. Book goes to press in December.

Canadian Agents:

The H. K. McCann Company, Limited

OLIVER MACHINERY CO.

GRAND RAPIDS, MICH.

Montreal, Que.—The Board of Control has awarded a contract for building a bridge over the canal at Church street to the F. J. Jago Co., for $78,000.

Building Notes

Toronto. — The Toronto Hydro-Electric system are to erect a new three-storey brick sub-station on the east side of Jefferson avenue, near Liberty street, at a cost of $20,000. The city architect has approved of the plans and a building permit has been issued accordingly.

Montreal, Que.—Operations on the site of Montreal's new million dollar theatre for Marcus Loewe on Mansfield and St. Catherine streets have been started by W. Lajeunesse & Co. Tenders for the erection of the building are being received. The building will have a terra-cotta front.

New Incorporations

The Weir Machinery Co. of Vancouver has been incorporated with a capital of $25,000.

The Pacific Steel Co., of Vancouver, B.C., has been incorporated with a capital of $100,000.

Canadian Metals & Equipment Co., of Vancouver has been incorporated with a capital of $25,000.

La Compagnie de Pneus Roger, Ltd., has been incorporated at Ottawa to manufacture automobiles, tires, engines, etc., at Montreal. Incorporators: W. J. G. Roger, T. Leduc and C. R. Lasalle, all of Montreal.

Machine Builders, Ltd., has been incorporated at Ottawa, with a capital of $50,000, to manufacture metal goods of all kinds. Head office, Montreal. Incorporators: J. W. Cook, T. B. Heney and T. B. Gould, all of Montreal.

Commercial Chemical, Ltd., has been incorporated at Ottawa, with a capital of $50,000, to manufacture chemicals. Head office at Toronto, and the incorporators are: E. A. Seburn, P. Robinson and Marcus Smith, all of Toronto.

Gunn Richards & Co., a New York corporation, has been licensed at Toronto, with a capital of $40,000, to carry on business as production engineers, factory organizers, with head office at Toronto. John Murray Clark is the attorney.

A. R. Whittall Can Co. has been incorporated at Ottawa, with a capital of $500,000, to take over the business of A. R. Whittall & Co., manufacturers of cans and containers of all kinds at Montreal. Incorporators: Albert R. Whittall, Fred R. Whittall, and M. A. Phelan, all of Montreal.

Canadian Molybdenite, Ltd., has been incorporated at Toronto, with a capital of $100,000, to acquire and develop mineral lands and deposits, with head office at Toronto. Incorporators: F. M. McDowell, G. R. Sproat and C. H. Kemp.

The Reliance Motor & Tool Co. has been incorporated at Toronto to carry on business as manufacturers of machinery and metal goods of all kinds at Toronto. Provisional directors are: W. B. Sturrup, J. S. Duggan, and C. A. St. Clair McKay, all of Toronto.

The van der Linde Rubber Co. has been incorporated at Ottawa, with a capital of $350,000, to manufacture rubber goods and appliances of all kinds, the head office being situated at Toronto. Incorporators are: W. A. McFarlane, V. T. A. Foley, and L. M. Keachie, all of Toronto.

Marine

Buy Ships in Vancouver.—The China Mail Steamship Co., which began trans-Pacific operations a year ago with the liner China, purchased from the Pacific Mail Co., has bought two steamers under construction at the Wallace Shipyard, Vancouver, B.C., paying $2,500,000 each for the liners, delivery to be made within ten months.

Will Build Wooden Vessels.—A. B. Mackay, of Hamilton, Ont., states that he has placed orders for six more scooners for the Mackay lake fleet, at a cost of $500,000. He declared that wooden sailing vessels of the type but on a larger scale than those used years ago are coming back on the Great Lakes. A four-masted schooner now under-construction at Meteghan, N.S., for Mr. Mackay will be launched on Nov. 15.

Vancouver, B.C.—It is reported to be not improbable that in the near future a shipbuilding yard on a somewhat extensive scale will be laid down on the south side of False Creek, Vancouver. Already plans have been drawn, and it is anticipated that a start will be made just as soon as these can be put into shape and a sufficient number of workmen engaged to go thead. The firm interested in the scheme is that of Messrs. John Coughlan & Sons, the well-known steel manufacturers who have a big steel plant on Beatty Street, Vancouver.

Tenders

Weir, Que.—Tenders for furnishing all labor and materials and constructing a steel bridge and appurtenances to be erected over the Rouge River (Rivington Bridge), addressed to the undersigned, will be received by the Municipal Council of Harrington until Saturday, December 2nd, 1916. All tenders shall be in accordance with the plans and the specifications prepared by the Engineer of the Department of Public Works and Labour, and which may be seen at the Office of the undersigned, Pierre Cantin, Treasuruer, P.O. Box 44, Weir, Que.

Ottawa, Ont.—By direction of the Honorable the Minister of Militia and Defence, the following old stores will be sold by public auction on November 9, at Toronto, Ont.:—Old brass, copper, gunmetal and ordinary, iron cast, iron wrought, files only, steel scrap, nickel. These articles may be seen on application to the Senior Ordnance Officer (Old Fort), Toronto.

Ottawa, Ont.—Tenders, addressed to J. W. Pugsley, secretary of the Department of Railways and Canals, Ottawa, Ont., will be received up to November 15 for the construction of a reinforced concrete elevator with a capacity of 500,000 bushels. Plans, specifications and blank form of contract may be seen at the office of the following:—Chief engineer, Department of Railways and Canals, Ottawa; railways, Moncton, N.B., general superintendent, Winnipeg, Man.; resident engineer, Fort William, Ont.; John S. Metcalfe Co., engineers, Montreal, Que. Contractors who wish to obtain plans and specifications temporarily for their own use may obtain same on depositing a certified bank cheque for $100.

Toronto, Ont.—Tenders will be received by Frank Barber, engineer of the Township of York, up to Nov. 6, for the supply and delivery of the following material:—Tender A-1—for supply and delivery of approximately 20,500 ft. of 24 in. cast iron pipe; A-2—for the supply and delivery of cast iron pipe (12 in, and smaller sizes); B-1—for supply and delivery of 24 in. special castings: B-2 for supply and delivery of special castings, 12 in. and smaller sizes; C-1—for supply and delivery of 24 in. valves; C-2—for supply and delivery of 12 in. and 6 in. valves; C-3—for supply and delivery of air valves; D—for supply and delivery of hydrants; F—for supply and delivery of tops, covers and plugs. Plans and specifications may be obtained at the office of Frank Barber, engineer, Toronto.

QUANTITY PRODUCER

This tool is used in shops where parts are keyseated by thousands. It is fitted with a high-speed steel rotary cutter for milling internal keyseats in one cut. Shops large and small can use the tool, and it is readily attached to a drilling machine for which it is designed. The tool keyseats in places where Keyseating Machine, Planer and Shaper can't reach. The right tool to use for keyseating interchangeable parts. There is no limit to the variety of work possible to be keyseated.

Personal

Robert Hastwell, superintendent of the International Malleable Iron Works at Guelph, Ont., passed away recently following a short illness.

Allan Purvis is appointed general superintendent of the Ontario Division, replacing **J. T. Arundel,** during his absence on account of illness.

J. H. Boyle is appointed general superintendent of the Eastern Division, replacing **Allan Purvis,** temporarily transferred to the Ontario Division.

H. J. Roast, of the James Robertson Co., of Montreal, was recently elected one of the three vice-presidents of the American Institute of Metals at its annual convention.

Goodwin Shenton has resigned his position with Lyman Tube & Supply Co., Toronto, to take over the position of engineer to Messrs. Taylor & Arnold, Ltd., Montreal.

Hugh Girvan, 120 Cannon Street, London, E.C., has been appointed sole agent in Great Britain by the Dominion Sheet Metal Co., Hamilton, Ont., for the sale of their galvanized corrugated and flat sheets.

Harry H. Angus, B.A.Sc., who has been in private practice at Toronto, has joined the firm of MacMullen, Riley & Durley, consulting engineers, Montreal and Toronto, Mr. Durley having resigned.

J. Edward Dailey, formerly with the Algoma Steel Co., Sault Ste. Marie, Ont. has been appointed general superintendent of the open-hearth steel plant of the Youngstown Iron & Steel Co., Youngstown, Ohio.

George Arthur Grier, president of G. A. Grier & Sons, Montreal, died on Oct. 25, aged 67. Mr. Grier was also president of the Dominion Glass Co., St. Lawrence Flour Mills Co., and a director of the Dominion Textile Co.

Thos. L. Morrissey, for 44 years mechanical superintendent for Robert Mitchell & Co., Montreal, died on Oct. 22, aged 72, at his home, 596 St. Antoine Street. He retired a short time ago on account of ill-health.

Dr. Albert H. Abbott has been appointed director of the Department of Labor of the Imperial Munitions Board, the appointment to take effect Nov. 1. Dr. Abbott has temporarily retired from the position of secretary of the Provincial Organization of Resources Committee appointed a few months ago by the Ontario Government.

Edwin F. Goodison, president of the John Goodison Thresher Co., of Sarnia, Ont., and one of the province's well known manufacturers, died on Sunday, at Hamilton, while en route from Sarnia to Toronto. The late Mr. Goodison was the son of the late Mr. Goodison, founder of the Goodison Company. He was 44 years of age, and a native of Mount Brydges, Middlesex County.

Hon. Col. Harry Cockshutt, president and manager of the Cockshutt Plow Co., Brantford, Ont., has completed and sent to France a report on the use of farm machinery in labor saving for use after the war. It is probable that the effect will be to largely increase the export trade of agricultural implements from Canada, Brantford being the chief centre of this industry.

Major Owen Thomas, who purchased motor cars for the Militia Department and has been styled a director of mechanical transport, has resigned and is going back to New York to engage in the automobile business. Major Thomas bought most of the equipment for the second and subsequent divisions. **Col. E. E. Clarke** will take over the direction of mechanical transport services.

Virgil G. Bogue, a well-known engineer, died recently. Mr. Bogue was born at Norfolk, N.Y., in 1846, and was connected with many important engineering works on this continent. He prepared the plans for the Rogers Pass tunnel on the C. P. R., through the Rockies, and also made plans for the development of the terminal and waterfront at Prince Rupert, B.C., for the G. T. P.

J. W. Norcross, vice-president and managing director; **F. S. Isard,** comptroller, and **C. A. Barnard,** director of Canada Steamship lines, sailed from New York recently on the American line boat St. Paul for London. The trip is largely for the purpose of cleaning up the loose ends of the English business in connection with the ships that have been chartered for service on the other side during the war.

C. W. Peterson of Calgary has been appointed by R. B. Bennett, M.P. Director-General of National Service, to the post of secretary of the National Service Commission in place of G. M. Murray, who resigned with Sir Thos. Tait. Mr. Peterson was born in Denmark, and is about fifty years of age. By profession he is an agriculturist. Latterly he has been engaged in business for himself, and is head of the Western Printing & Lithographing Co. of Calgary, and editor of the Farm and Ranch Review.

Trade Gossip

The Reliance Machine Co., Toronto, have sold two 6-inch shell boring machines to the Canadian Blower & Forge Co., Kitchener, Ont.

The Main Belting Co. of Canada, Ltd., Montreal, have appointed W. W. Hicks, 567 Banning St., Winnipeg as sales agent for that district.

Russian Firm Changes Name.—We are advised that the business formerly conducted by L. Knoop at Moscow, Russia, has been taken over by the Trading & Industrial Co., "Volokno" of Moscow.

Copper Output in U.S.—Twenty leading copper companies operating in the United States, Canada and South America, produced approximately 895,000,000 pounds of copper in the first half of 1916, an increase of 295,000,000 pounds, or 50 per cent. over the corresponding period of last year.

Trade Enquiry.—The following enquiry has been received by the Department of Trade and Commerce Ottawa. 1245. Steel bars, plates, sections, billets, etc.—A Dundee firm will be pleased to enter into correspondence with reliable iron and steel manufacturers in Canada with a view of obtaining quotations for the above.

Owen Sound, Ont.—At the meeting of the Utilities Commission held on Oct. 24, it was decided to reduce the light and power rates of the Hydro-Electric system 10 per cent. The decision followed representations which were made to the Hydro Commission in July. This is the first reduction since the Eugenia Power lines were connected with Owen Sound's system.

Canadian Business Tax.—Twelve millions of revenue is promised from the operation of the business tax imposed by the budget of the last session of Parliament. The initial assessment is due in November and payments are now being made to the Finance Department by corporations and individuals whose excess profits come within the scope of the Act. Some will pay as high as a million dollars. The money appears to be forthcoming willingly.

French Farmers Need New Machinery.—The French Government has officially designated a commission for developing the use of agricultural machinery among the farmers of France. In the memorandum addressed to President Poincare, upon which the official action was based, Jules Meline, the Minister of Agriculture, calculates that for the invaded and devastated districts of France alone

Saving or Wasting?
The manner in which you handle the drinking water problem in your plant may seem to be a small matter to you—but investigate. The results will be surprising.
The old-time faucet is costly. Running hour after hour, day after day, its ceaseless flow is costing you money, yet without any better service.
Puro Saves 35%
A Puro Sanitary Drinking Fountain will cut that water bill 35%. We can prove that it has done that for others.
It will give every employee a safe, saner draught of bubbling water free from the contamination of the common drinking cup.
In a word, it is the only sanitary Drinking Fountain that is really safe, sanitary, simple, automatic in control, and easy to attach.

Man'f'rs of "Barnes-made" Products
Springs, Screw Machine Products, Cold Rolled Steel and Wire

there will be needed 2,000 motor tractors, in addition to the 200 already available; 110,000 plows, 50,000 harrows, 22,000 planters and 15,000 reapers.

Vancouver, B.C.—The Dominion Government will promote the building of merchant ships in Canada for Norway. A telegram received from Ottawa reported that H. H. Stevens, M.P., had stated that an Order-in-Council granting necessary permission had been passed. Contracts for three vessels valued at $3,500,000, were already signed with Vancouver shipbuilding yards, and only required the assurance of the Government that the transfer would be granted on completion to become effective. Orders for seven or eight other vessels will be given almost immediately, and the total value will reach not less than $20,000,000.

Women Munition Inspectors.—The first class in Canada for women munition inspectors was started last Friday at Central Technical Schools, Toronto, when ten students, the total number possible for a class, were given their first instructions. The course will take a week or ten days and the hours will be regular school hours. This class was filled up immediately the announcement was made that it was to be held and about a hundred more have applied to be placed in later classes. As soon as the course is completed these women will be placed in positions now held by men. All applications must go through Miss Wiseman, 504 Traders Bank Building, Toronto and her hours are from 9 to 10 in the morning and from 5 to 6 in the afternoon.

Car Ferry Across Lake Erie.—A car ferry route has been established across Lake Erie between the ports of Port Maitland and Ashtabula, on the south shore of Lake Erie, by the T. H. and B. Navigation Co. The initial trip of the car ferry was made Oct. 21st with a full load for Hamilton and other points. The steel car ferry, Maitland No. 1, is the latest in car ferry building, carrying thirty-two loaded freight cars, and is equipped with every device for safe handling of the cars and freight. She will ply between Port Maitland, Ont., and Ashtabula, Ohio, connecting at the latter point with the New York Central and with the Pittsburg and Lake Erie at Youngstown, thus affording a new and fast route from the Pittsburg. Connellville and Cleveland districts.

The Polson Iron Works, Toronto, have signed a contract for two steel freighters for Christoffer Hannevig, Christiania, Norway. The ships will be 261 ft. over all, 43 ft. 6 in. beam, and 22 ft. 11½ in. deep. The total deadweight carried will be 3,500 tons. The two vessels will cost about $1,200,000, and will be completed July or August, 1917.

Intercolonial Railway Improvements. Hon. Frank Cochrane, Minister of Railways, accompanied by F. P. Gutelius, General Manager of Government Railways have returned to Montreal from a tour of inspection of improvements being completed on the Government system of railways at several points in the Maritime Provinces with a view to the handling of the increasing shipments of munitions, transportation of troops, etc., over a quarter million dollars being involved. The Minister expressed satisfaction with the work, and Manager Gutelius said the Government railways had undertaken to handle 80,000 tons of war supplies per month this winter, an increase of twenty-five per cent. over last winter's business.

Advertising the West.—Western Canada attractions will be made known in all the chief centres of the United States during the coming winter in a more attractive form and on a more extensive scale than has been hitherto attempted. By means of the moving-picture camera, the life and resources of the West will be shown over a circuit covering 4,000 theatres, and in this way many thousands of people will be reached and interested in the Dominion who might otherwise only hear of the country incidentally. The films have been taken under the auspices of the Grand Trunk Pacific, and will include a variety of pictures in the prairie harvest fields, and through the Canadian Rockies. One of the most interesting pictures is the arrival of a fishing boat at Prince Rupert with 80,000 pounds of halibut on board.

G. T. R. Celebrates Anniversary.—On Oct. 27, was celebrated the sixtieth anniversary of the inauguration of railroad communication between the cities of Montreal and Toronto. On October 27th, 1856, the Grand Trunk operated its first through train between these two important Canadian centres. Toronto and Montreal had been dependent for their communication upon the St. Lawrence waterway and the stage routes, and after the close of navigation each year intercourse was maintained with great difficulty. The Grand Trunk Railway Co. was incorporated in 1852 to build a railroad between the cities, the undertaking being looked upon as one of great national importance. The first section from Montreal to Brockville, 125 miles, was completed in November, 1855, and it was on the 27th of October of the following year that the second section from Brockville to Toronto was thrown open, joining up the two principal centres.

Subscriptions Invited From Friends Abroad

Canadian Machinery and Manufacturing News is published weekly. Representing, as it does, the industrial life and activities of Canada, it should prove of very considerable value to those who wish to buy Canadian products, and to those who may wish to sell in Canada.

As a technical journal it compares very favorably, we think, with any other high-class publication, and will be found to be well worth the subscription price, and more.

If you are favorably impressed with this number, we think you will find other issues equally interesting. Canadian Machinery contains from eighty to one hundred and twenty pages—fifty-two issues in the year. We invite subscriptions from our friends abroad, and attach a coupon for the sake of convenience.

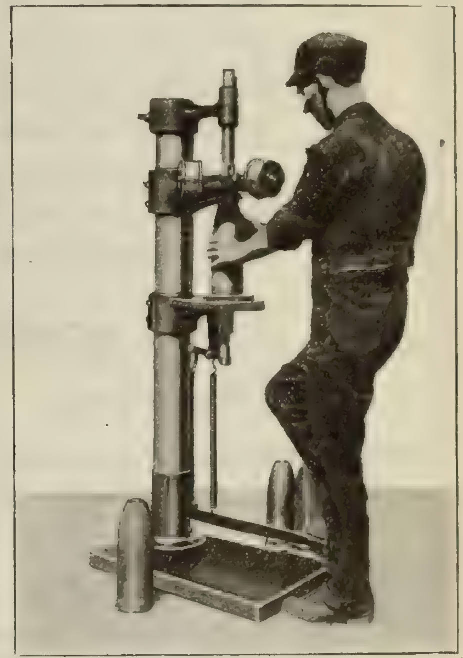
CANADA'S DEPARTMENTAL HOUSE FOR MECHANICAL GOODS

MONARCH
Milling Machine
(Made in Canada)

For Milling the three slots in the nose of

Mark 7 Shells

Adjustable to take any size shell from 4.5 to 9.2 inclusive.



ONE MOVEMENT of foot lever clamps the shell and feeds the three cutters in to the right depth.

CAPACITY ON 4.5—6 to 8 shells per minute. Actual cutting time is simply — "zip" and the three slots are finished.

THE MACHINE is complete with High Speed Cutters and drive pulleys which should run at about 550 revolutions per minute. It can be driven by three 2-inch belts, either from overhead counter or line shaft. The clamping device does not interfere with copper band, and altogether it will be found to be a very satisfactory tool—CONVENIENT and ACCURATE.

CANADIAN MACHINERY

You Sell Something to Somebody

AND to that somebody you must make known — by advertising — what you sell, why it is good, and so on. Also, you must have a medium—a publication read by your customers or should-be customers.

All this you consent to without demur. What may perplex you a little is the **Medium** to employ.

This should not be a puzzle if your product or commodity is one purchased by the general public, and if your constituency of buyers is found everywhere in Canada.

The one medium of quality and of national circulation is

MACLEAN'S
MAGAZINE

You can find no substitute for it at a lower cost, and none that will carry your proposals or announcement with greater acceptability.

The conclusion is plain.

N.B.—Objectionable advertising not accepted. Both editorial and advertising columns are closely censored to keep them clean and decent.

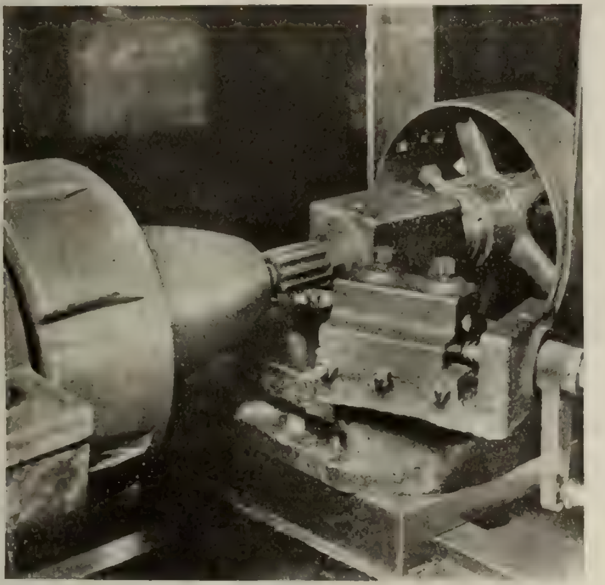
4.5 Mark VII Plant For Sale

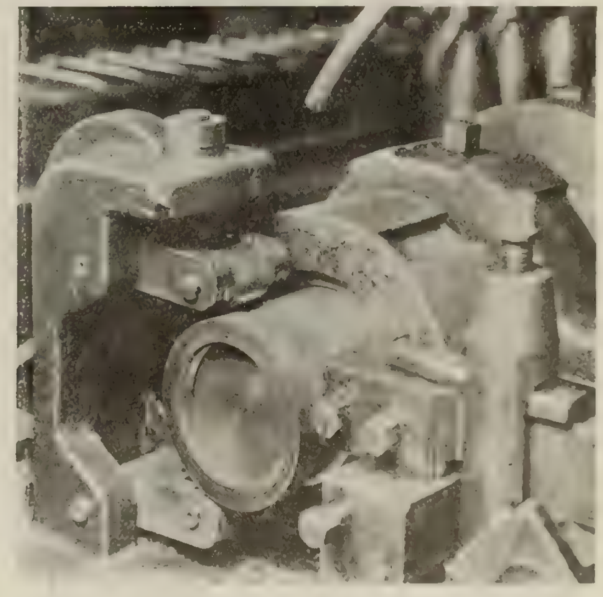
Immediate Delivery

The following machines have been changed from the mark V shell to the mark VII. We will dispose of these machines with their tooling. Every machine has been examined and put into first-class shape.

2—30" American Turret Lathes, Triple Geared; 36" turret base; will take both 3" and 4" boring bars; extension heads on turrets; special small turret or cross-slide with six 1½" holes; 20" 3 jaw Universal steel chucks; Power Feed and Power Reverse. All tooled, boring bars, pot chuck, etc., each	$1300
2—24" Morse Turret Lathes; with 3-jaw Universal chuck; 16" base turret having six 3" holes. All tooled, with pot chuck, for hogging-out base of Mark VII. shell, each	$800
1—Jenckes Band Turning Machine; collet chuck. This machine has band-turned about 15,000 shells. All tooled for Mark VII. shells	$900
1—24" x 12 Bertram Engine Lathe, all tooled with special milling fixture for threading the base recess of Mark VII. shell	$900
1—24" Morse Special Turret Lathe; carriage feed; all tooled with pot chuck and forming tool for finish base recess of Mark VII. shell, each	$900
1—Special Painting Machine, with 110 volt alternating current motor	$50
1—150-ton Hydraulic Nosing Outfit, consisting of 1 Triple Action Pump (Perrin); 1 Accumulator (Perrin); 1 Nosing Press (Perrin), with Mark VII. die complete; 1 Chapman Banding Attachment for Press	$1075



The only correct time to perform the seating operation is to do it in the same fixture with the milling operation This fixture will fit any engine lathes, and costs only $120.00, including milling, cutter and seating tool. The angle of seating can never vary.



Most of the British Shells may now be knurled. This fixture is quick in operation and most accurate. The cost is only $100.00, and it can be used as an attachment to almost any lathe.

We have all gauges for both Mark V and Mark VII Shells, consisting of plug, length, outside diameter, form, thread and seating gauges.

Our Nosing Die Outfit is the best for the Mark VII shell. Leading manufacturers, such as P. L. Robertson Co., Milton; Wilford & Co., Lindsay; Manitoba Engines, Ltd., Brandon; Canadian Westinghouse, Hamilton; Vancouver Engineering Works; Vulcan Iron Works; Otis Fenson Elevator, etc., are using our dies.

Toronto Type Foundry Company, Limited

50 Coleman Avenue, TORONTO, ONT.

THE TURNER TURRET

is very profitable even on short run work

A Turner Turret is profitable on runs of work shorter than most machines can be set up for **because the tooling is simple and easily applied.**

The Turner Turret is a machine of practical design, rigid construction and wide adaptability—a machine that cuts operating time to closest limits, turns out accurate work and does not require a skilled operator.

Mail us your blue prints and let us give you estimates on the Turner Turret—the machine of "Drill Press Simplicity—Turret Lathe Output."

For Engineering Men Especially

VENUS 10¢ PENCIL

NO group of men demands more of a pencil than does the engineering profession. For very fine lines a very hard pencil is wanted; for blacking in, the very softest—and between these two extremes there are many gradations for which a special hardness is desirable. That is why Venus pencils are made in 17 degrees from 6B softest to 9H hardest. These with the hard and medium copying, will do whatever you want a pencil to do, and will do it perfectly. Look for the distinctive Venus water mark finish.

FREE To technical users writing on their business letterhead a box of Venus drawing and copying pencils and a Venus Eraser will be sent free.

Write to-day for yours.

The Grinding Wheel that Pays Dividends

THE logical grinding wheel to use on any grinding job is the wheel that pays dividends—dividends in the added amount of work it produces—the time it saves; in the reduction of wheel loss and in the saving of labor.

HERE IS AN ALOXITE WHEEL THAT SURELY IS PAYING

It is roughing and finishing the shanks of machinery steel gears in a Cincinnati plant, removing .012 in roughing and .001 in finishing.
The wheel cuts clean and fast—requires but little dressing—gives a splendid uniform finish and has broken all shop production records for this job.

Its the Right Wheel in the Right Place—just the sort of paying wheel we can give you for any grinding work.

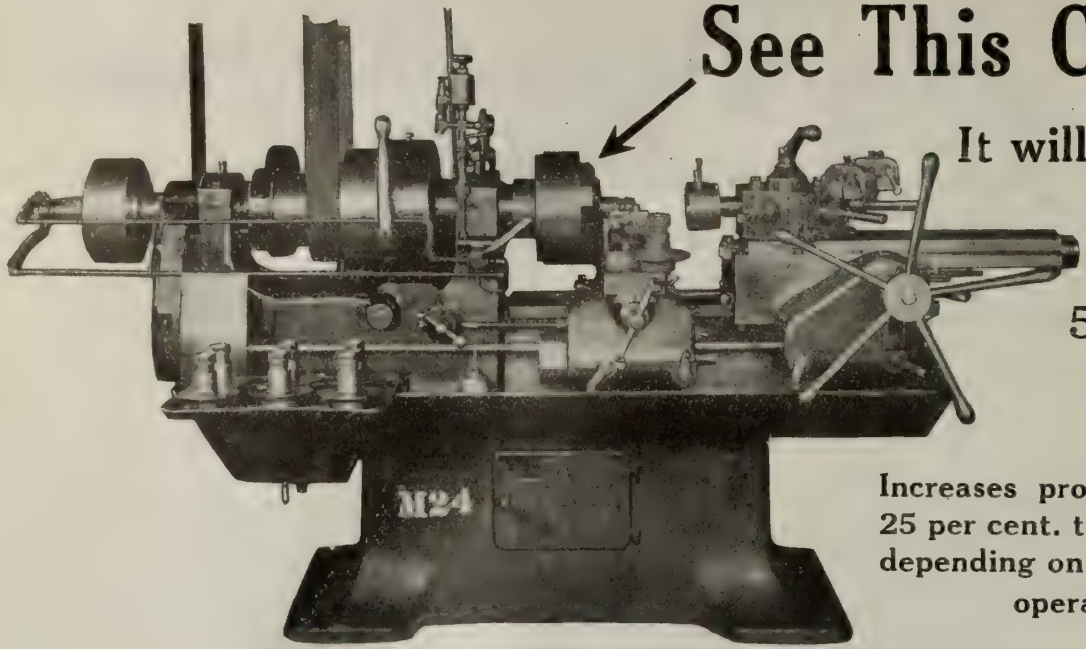
See This Chuck!

It will Chuck a Piece of Work in 5 Seconds



Increases production from 25 per cent. to 50 per cent. depending on the length of operation.

Are you making Shells, Shrapnel, Fuses or Piston Rings?

If you are, get in touch with us. We want to lay a cost-cutting plan before you. We want to prove to you that

Detroit Pneumatic Chucks

will chuck a piece of work in five seconds. THIS is just about fifty-five seconds quicker than it can be chucked by hand.

The shorter the operation, the more chucking and the greater the saving with DETROIT "AIRGRIP" CHUCKS.

They fit all hollow spindles and are made entirely of steel. Gripping power is adjustable.

Made in two-jaw and three-jaw types. All sizes from 6" to 18" diameter.

Our Chucks are made entirely of steel; our workmanship is of the very highest grade; our air cylinder is a decided improvement over anything else on the market, as packing on piston is adjusted automatically.

We are just completing a new factory which will be the largest and best equipped plant in the United States for the exclusive manufacture of pneumatic chucks.

We have some open territory and will be glad to hear from good, live agents.

DO YOU

Want to Save Your High Speed Steel Bit Ends?

Figure out how much you *lose* in a year through the high-speed steel scrap pile.

Imagine how much you could *save* if you could use the bit ends up instead

AND YOU CAN

by means of a "National" Electric Spot Welder. Hundreds of other manufacturers are doing it—cheating the scrap pile every day.

Want to know HOW?

We want to show you.

Only cost you a stamp and a few minutes time to get the data.

Want to Reduce Production Costs?

That's the eternal problem with modern manufacturers—especially just now with raw material prices sky-high and still soaring.

If you use rivets or solder in assembling your product,

YOU CAN DO IT

by spot welding the joints with a "National" Electric Spot Welder instead of riveting or soldering them.

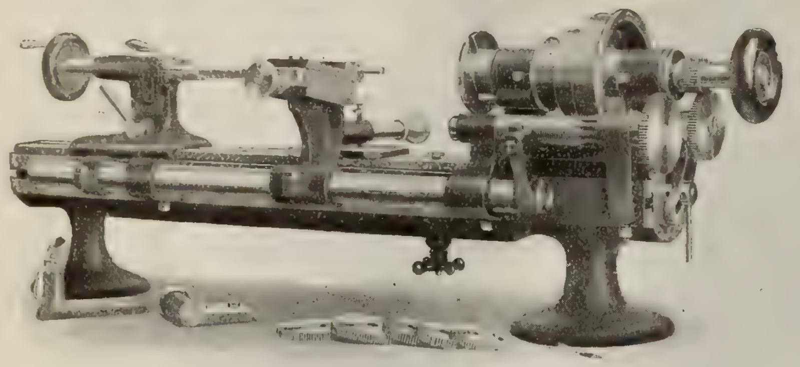
It's CHEAPER, QUICKER, BETTER.

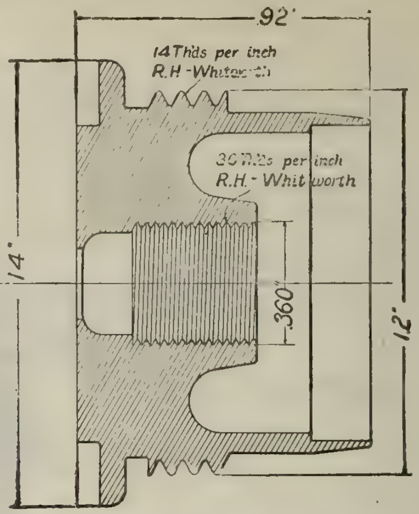
The same stamp will bring you the information you require on this also.

NATIONAL ELECTRIC WELDER COMPANY

WARREN, OHIO, U.S.A.

THE CATARACT BENCH LATHE WITH CHASING ATTACHMENTS





We have sold many of our lathes to Canadian concerns who are eminently satisfied with results. Will you be next?

For work requiring greatest accuracy and rapidity, THE HARDINGE CATARACT BENCH LATHE will not disappoint you. Machine equipped with Automatic Chuck Closer for rapid operation of chuck, and with chasing bar arranged with multiple point, chasing tool is producing from ten to twelve hundred 14-pitch Whitworth threads on primers in TEN HOURS. Prompt deliveries. Catalogue No. 15 is ready to mail TO YOU. You are invited to write for it to-day.

KEMPSMITH

UNIVERSAL MILLING MACHINES

When installing a Universal Milling Machine for tool room work, one of the prime considerations is simplicity of machine and convenience of operation.

Kempsmith Milling Machines are notable leaders in these two requirements. Note especially that all feeds are reversed by one lever at the front of the knee. Likewise all power feeds are tripped and engaged by one compound lever, also located at the extreme front of the knee. The swiveling table is clamped rigidly at any angle by a quarter-turn of a single bolt.

Our catalogue illustrates and describes more fully the feature mentioned. A copy will be gladly sent on request.

This Tapper Lowers Costs

Our claim is that the

R. & S. Tapping Machine

is the speediest and most sensitive tapper built. This claim is based on a knowledge of what other tappers do.

If our claim is borne out by the testimony of its users and by the performance of the Machine itself, there is sound reason why you should at least investigate the R. & S. Tapping Machine.

Our Catalogue will give you fuller particulars. Send for it.

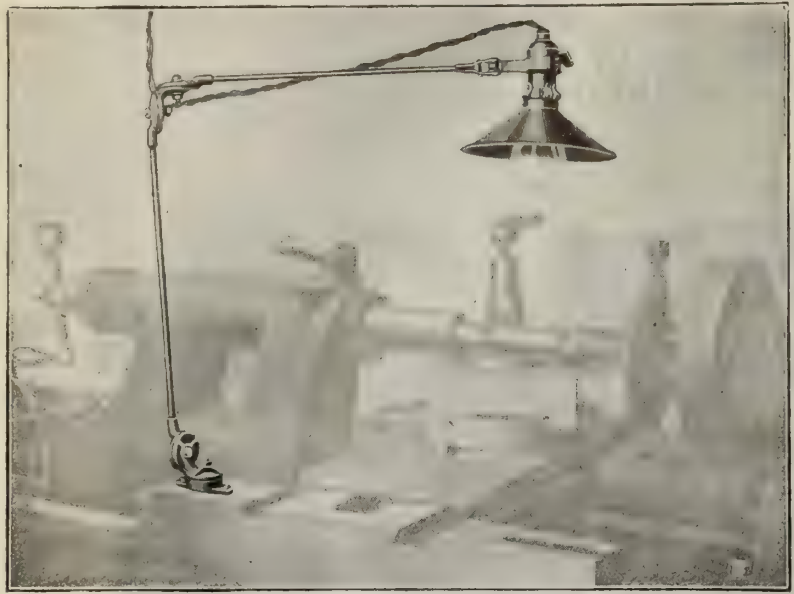
More Production — Greater Accuracy — Less Globe Breakage — Happier Men

That sums up the argument on this lamp bracket. Three frictional universal joints that can't wear out and are adjustable for any desired tension give the reason.

Just a slight push or pull puts the light where you want it, when you want it.

Any workman will do more and better work if his light is always in just the right place and under instant control.



The Searchlight Bracket

will pay for itself many times over in one season. The period of short days is approaching. Many shops are working night and day the whole year through. The cost is trifling compared with results. Only $1.50 each, with big discount, according to quantity.

Write now for samples and let us show you how your whole factory could be equipped at a big saving to you. Any quantity sent on 30 days' trial to any responsible concern. You can't possibly lose, and **You Might Win!**

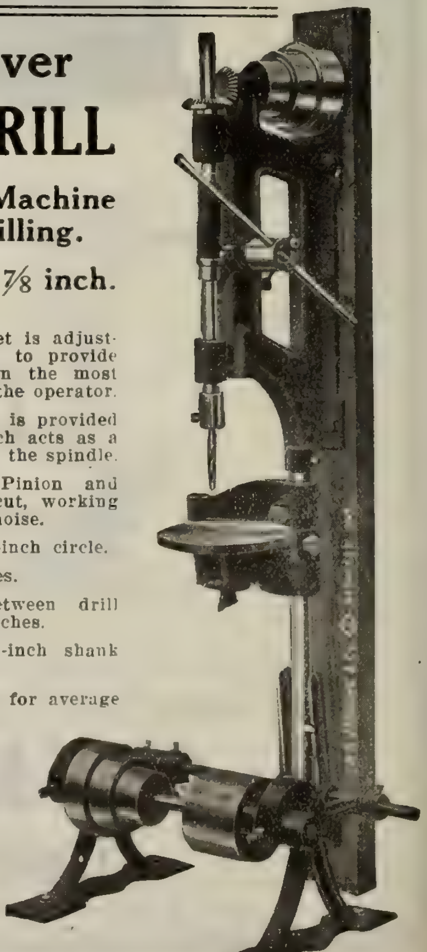
16 in. Lever POST DRILL

A Giant Little Machine For Light Drilling.

Will drill up to ⅞ inch.



The Feed Lever Socket is adjustable on the feed shaft, to provide for setting the lever in the most convenient position for the operator.

An adjustable friction is provided for the feed shaft, which acts as a balance to the weight of the spindle.

Bevel Gears, Feed Pinion and Rack are all machine cut, working smoothly and without noise.

Drills to centre of 16-inch circle.

Run of feed 5¼ inches.

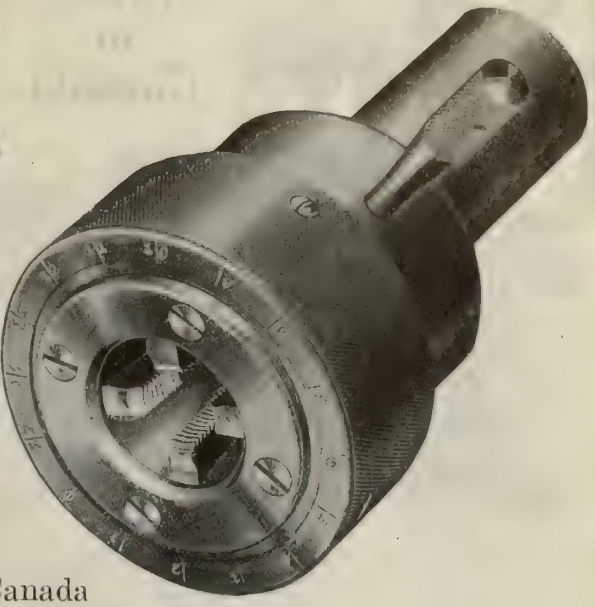
Greatest distance between drill spindle and table, 22 inches.

Spindle bored for ½-inch shank twist drills.

Speed of countershaft for average work, 300 per minute.

A. B. Jardine & Co.
Hespeler, Ontario

They're All Using Murchey Tools



Practically all the largest makers of shells in Canada and the United States are using Murchey Taps and Dies. They have certainly made a hit throughout this country, and judging from present orders their popularity doesn't seem to be diminishing.

The superiority of the **Murchey** design has been a big factor in building up the success of **Murchey Tools** in the plants of shell makers.

And consider this—

Re-chucking is eliminated, thus doing away with all chance of the work getting off-center.

Use **Murchey Tools** and you can get "A1" results without tying up capital and floor space in expensive machinery. Let Murchey Collapsing Taps and Automatic Dies stand between you and increased power, heavy upkeep and depreciation.

The details are yours for the asking. Write us **to-day**.

Elmes Hydraulic Press No. 676

With ¾-in. Automatic Lever Operating Valve No. 677-A

This press is of steel and semi-steel construction, and the stands which support the press are threaded at the ends to receive the steel columns and have holes for fastening to the floor. The platen is guided by the columns.

The operating valve is attached to the cylinder, and is designed with a weight to be set for the pressure desired, and releases automatically. To start the ram up, the lever is pushed down; upon the ram reaching the desired pressure, the lever automatically releases (acting as a safety valve as well), causing the ram to descend. Valve body is made of bronze, and other parts are made of tool steel and machine steel. If desired a hydraulic gauge can be attached to show the various pressures, although with this valve it is not necessary.

Write for our Hydraulic Machinery Catalogue.

Over 50 years' experience building hydraulic machinery.

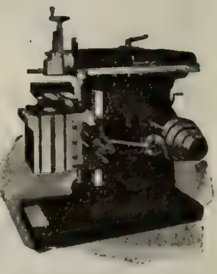
Cut Your Shop Costs

Nobody would think of putting 16-inch lathe work on a 30-inch lathe, then why leave small parts on a large Milling Machine?

A Steptoe Hand Miller or small power feed can be handled quickly and will cut your production cost. You will have less money invested in your Milling Machines and have more machines to do the work.

That same principle applied to your small planer work will cut the cost of planer work.

A Steptoe Shaper will do the work faster because it can be handled quicker.



The John Steptoe Company, CUMMINSVILLE
CINCINNATI, OHIO, U.S.A.

Millholland 1⅝x10 Turret Screw Machine

The combined result of two generations of engineering and mechanical experience. While, as a whole, it is no radical departure from established lines of the turret lathe, it has many original features, and with these features are combined well-known devices.

Safety, rigidity, convenience, production and durability are the ideas behind every step in their construction.

Your request will get you full details and specifications by early mail. Make it.

Millholland
Machine Company
INDIANAPOLIS, IND., U.S.A.

Air-Operated Arbor Press

Increases Production 20 to 100%

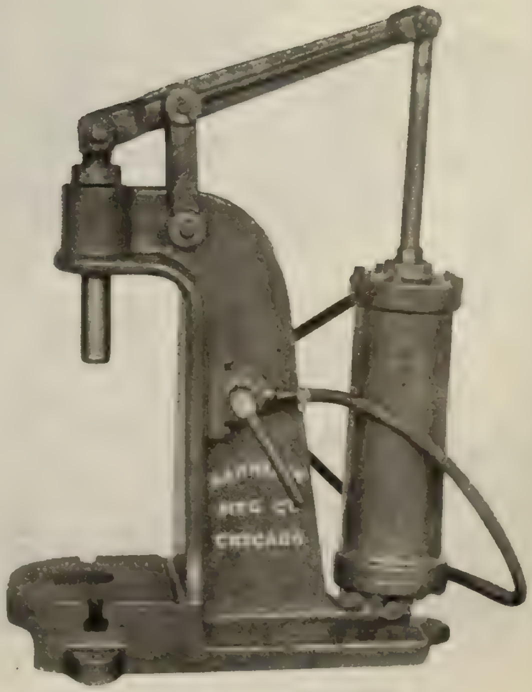
This Hannifin air-operated arbor press is designed to eliminate the slow and tiresome operation of a hand-operated arbor press.

With the air-operated arbor press, arbors and bushings can be pressed into place with one stroke, and no exertion is required of the operator.

The downward or pressing stroke of this press is an even, steady movement, and the upward stroke is a fast stroke, making the time of the complete operation a minimum.

The air-operated arbor press is constructed of the highest quality of workmanship and material and is of a durable and simple construction.

The arbor is provided with a stop collar which enables the setting of the downward stroke to a definite stop, so that duplicate operations can be performed without attention being given to the position of the arbor or bushing being pressed into position.



The above press is made in two sizes.

The power developed in No. 1 is 7,900 pounds at 80 pounds air pressure, and No. 2 developing 12,000 pounds at 80 pounds air pressure.

Send for complete specifications.

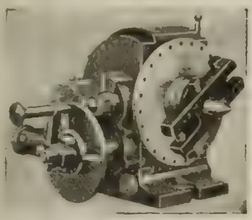
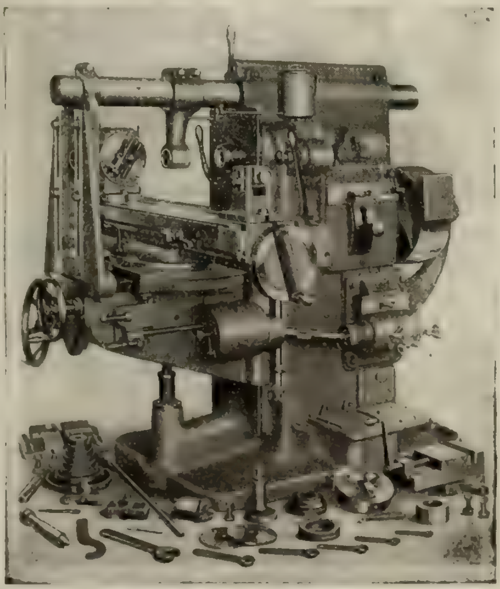
A Hardened and Ground Worm in Every B. & S. Spiral Head



After being carefully cut, the indexing worm on our Spiral Heads for Universal Milling Machines is hardened to insure maintenance of the original accuracy. The teeth are then ground true to pitch and form on special precision machinery, eliminating all errors due to hardening. After this the assembled head is put through a very sensitive test, proving that it indexes exactly enough for the most delicate work.

So much for accuracy and reliability; in addition, the construction is strong and rigid. The graduated index sector allows the arms to be set to include any number of holes without counting. Also the index pin can be moved to the nearest hole without disturbing the work or the work adjusted without moving the pin, for the crank has radial and circumferential adjustment. These points are all important, for over 70 per cent. of universal milling depends for success on the Spiral Head.

B. & S. Universal Milling Machines, on which these Spiral Heads are furnished, combine the power and ruggedness required for manufacturing, with the accuracy and handiness necessary on tool work. You will find them doing well the fine, jeweler's tool work and manufacturing in the big engine and machine tool shops, for the range of sizes covers all requirements. If you have work for a Universal Milling Machine we have an efficient machine that will just fit the job.



Brown & Sharpe Mfg. Co.

PROVIDENCE, R.I., U.S.A.

THE FAMOUS FIVE

ON ACTIVE SERVICE

One or other of the "Famous Five" Files will be found on the benches in nearly every workshop in Canada. The machine shop man likes them for their balance and cutting qualities.

The carpenter chooses them for the same reasons.

The blacksmith prefers them for their rugged strength.

Sixty millions of them are made and used every year.

And they always give satisfaction. Specify them when ordering.

The "Famous Five" are:

CLEVELAND DRILLS

"Don't Scrap This Drill"

Just because its tang is twisted off is no reason for scrapping it. In the tool room you'll find a

PERFECT DOUBLE TANG SOCKET

You'll be interested in Catalog 358

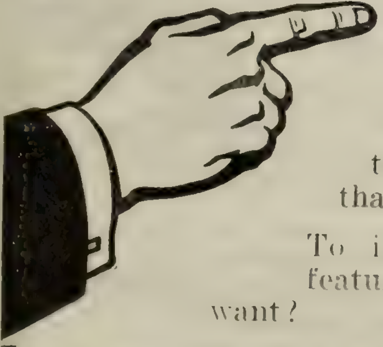
Get it. Grind a new tang on the drill—just below the old one—and slip it into the "Perfect Double Tang" socket. You'll have this drill back on the job in three minutes, and it will be 25 to 60 percent stronger than before.

The "Perfect Double Tang" socket gets full drilling life from every drill regardless of the life of the original tang, and it eliminates the waste incident to broken and twisted tangs.

It's in one piece—simple, inexpensive and fool-proof —a necessary adjunct to every economical shop.

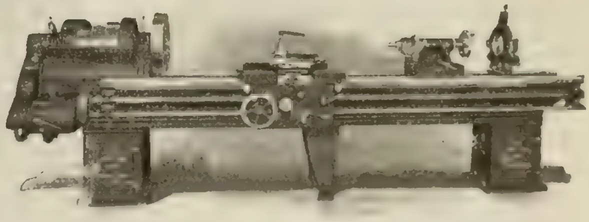
THE
CLEVELAND ◆ TWIST DRILL CO.
NEW YORK CLEVELAND CHICAGO

THIS LATHE HAS THE FEATURES YOU WANT



Here is a "heavy turning" tool of wonderful accuracy — with costly, efficiency-producing features — offered at a price that is very modest indeed!

To illustrate: Here are some features. Are they not want you want?



SIDNEY!

SAFETY! SPEED!

17 inch and 19-inch plain change engine lathe, all double back geared. Built 8, 10 and 12-foot lengths of bed.

20% steel mixture in bed casting. You know what that indicates.
Heavy carriage vee 2½" wide. High carbon rack pinned and bolted to bed.
50-point carbon steel head stock spindle.
Offset 1" off centres for heavy duty work.
40-point carbon lead screw 1 7-16" diameter, 2 pitch thread. And others.
Write SIDNEY for all the features that make this lathe exceptionally attractive.

Four Big Things in Canadian Industry

BIG buying is going on in Canada in the Metal-Working, Machinery, Iron and Steel, Foundry, Shipbuilding and Power fields.

Canada's trade for the month of July, 1916, showed an increase of 141%—imports $63,622,587; exports $104,964,270. Business in Canada *is* good. The war has aroused an unsuspected and surprising resourcefulness in Canadian manufacturers. They are making money, extending their plants, buying equipment. They are confident as to the future and are deeply engaged in industrial preparation.

The Buyers in the fields mentioned above can be reached through these

Four Exclusive MacLean Mediums

Canadian Machinery — Canadian Foundryman — The Power House — Marine Engineering of Canada

Canadian Machinery serves the machinery and metal-working industries. L. S. Starrett Co., Niles-Bement-Pond, and some scores of other well-known concerns have used space regularly for years. In fact, **all** the firms who are **successfully** doing business in the metal-working field of Canada are doing business with **Canadian Machinery.** (Export Numbers are sent abroad monthly.)

Canadian Foundryman serves the foundry trade of Canada—an ever-increasing field. Every foundry is busy. One foundry supply dealer said recently that his July business was larger than **for any five months** in any previous year. Labor-saving equipment, as well as supplies and standard lines are being purchased heavily. **The Canadian Foundryman** influences this buying—at a small cost to the firms who are getting the business.

The Power House serves the power field, and the buyer of power equipment in every province of Canada. It serves also the manufacturers of power equipment as is perceived in the following quotation from a letter from Wm. B. Pierce Co., Buffalo (date Sept. 1, 1916).

> "The reason we are increasing this space in the 'Power House' is that we have found the 'Power House' cost us less per inquiry than any other publication we have used in the power plant field, and that the inquiries are generally from very high-class concerns. The percentage of inquiries that we receive that are turned into sales is unusually high, so that 'Power House' also stands first on our list for low cost per sale."

Marine Engineering of Canada—Shipbuilding in Canada has received a tremendous impetus as a result of the war. Shipbuilding plants are being built on the Atlantic and Pacific Coasts in considerable numbers, while established shipyards have more business than they can handle. **Marine Engineering** is the only exclusive marine paper published in Canada. Its circulation is among shipbuilders, shipowners, naval architects, government officials, masters and engineers. These men and classes are reached effectively, at small cost, through **Marine Engineering.**

EACH of these papers has a *National* paid-for (full price) circulation thorough in character. Each is an acknowledged *Power* in its own field. Send for specimen copies and advertising rates.

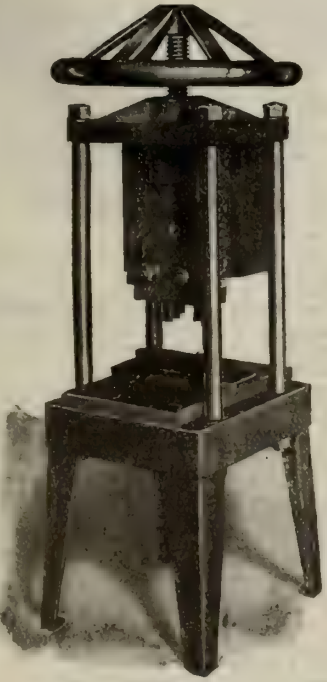
Do not postpone. Send Coupon NOW.**

ANOTHER TIME SAVER



IT'S a Screw Press and is used for proving and and testing newly made dies. It eliminates that expensive setting up of presses which would otherwise be necessary.

The Globe Screw Press is everything it should be. That's because it was designed and is made by our own toolmakers—men who use the Press daily and know its functions.

You need this Press if you make dies or tools for sheet metal manufacturing. Send for circular and mention "C.M."

THE GLOBE MACHINE & STAMPING CO.
CLEVELAND, OHIO

Preparedness—

THE watchword of the day. Start now and be ready for the big business that is coming.

SPECIAL machinery and equipment is our forte. We ask the opportunity of having our engineers solve your problems.

The Davis-Bournonville Apparatus Leads the World

Portable Outfits from $130 to $13,000.

All kinds of Welding and Cutting Plants and Supplies.

Medal of Honor—Highest Award at Panama Exposition.

Agents for Electrolytic Oxygen, 99.80% pure.

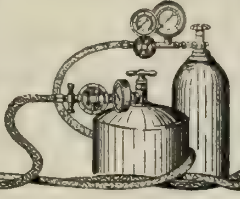
We also do repair work of all descriptions.

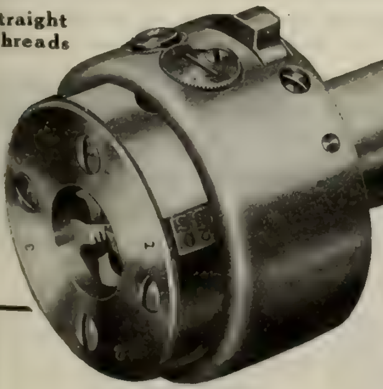
Write us for price list.

Carter Welding Company

561 King Street West, Toronto
Tel. Ade. 893

Canadian Agents for
The Davis-Bournonville
Apparatus





Straight Threads

No Possibility of tapering

Automatic Self-opening

H & G DIE HEAD

The quick release insures straight cutting to the same point *every* time.

Once the chasers are set, they'll stay set. They cannot change size when opening or closing. The cams are all enclosed so that chips cannot get in and clog the working of the head.

Send for the H&G Booklet and learn all about them.

New Haven, Conn.

Oxy-Acetylene Welding and Cutting

Manufacturing metal furniture, using the Prest-O-Lite Process

Makes Greater Savings In Metal Manufacturing

Oxy-acetylene welding is a simple, low-cost, easily learned method of metal joining that makes possible marked economies in production costs, and increased quality in the finished article. Welded joints are rapidly displacing riveted and threaded joints of many kinds.

From the manufacture of heavy machinery to the making of fine surgical instruments, oxy-acetylene welding is more than paying its way. Welded joints can be made as strong as any other part of the finished article. Metal is left in ideal condition for subsequent machining.

For the same reasons that oxy-acetylene welding is so valuable in metal manufacturing, it is highly profitable in all kinds of metal repairing. Just one important welding repair could easily repay you for all needed apparatus, by preventing serious tie-ups in production, to say nothing of the savings on old parts reclaimed and the troublesome dismantling avoided.

Prest-O-Lite PROCESS

Employs both gases (acetylene and oxygen) in portable cylinders. Prest-O-Lite Dissolved Acetylene (ready made carbide gas) is backed by Prest-O-Lite Service, which provides dry, purified gas, insuring better welds, quicker work, and lower cost, and also avoids the large initial outlay and heavy depreciation incurred in making crude acetylene in a carbide generator.

Necessary equipment is not expensive. We furnish high-grade welding apparatus for $75; acetylene service at additional cost. Adaptable for oxy-acetylene cutting by the purchase of special cutting blow pipe. Thorough instructions are furnished free to every user of Prest-O-Lite Dissolved Acetylene; any average workman who understands metals can learn the process quickly and easily.

Send for thoroughly illustrated literature that shows specific instances of the savings made and how easy it is to apply these economies in your shops.

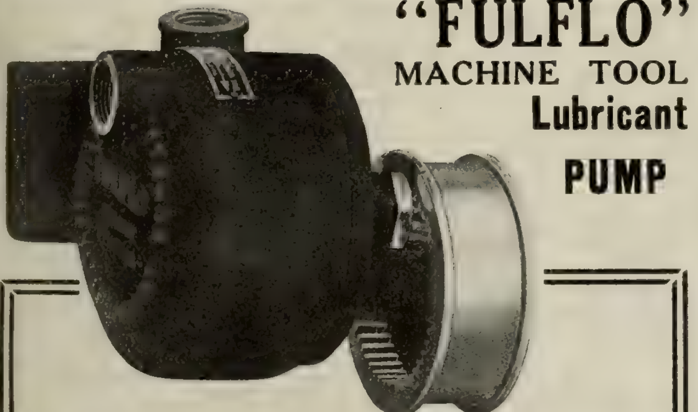
"FULFLO"

MACHINE TOOL Lubricant PUMP



You can drive your machines faster

but your cutting tools won't stand it — the speed burns them up.

A cutting tool will stand up to higher speed and heavier feeds, providing it is kept cool.

The "FULFLO" Machine Tool Lubricant Pump supplies a good "HEAVY" stream of compound sufficient to carry away all the heat.

No gears or other close-fitting parts to be affected by the grit, dirt, or small chips that are always present in the coolant. No clogging.

The only working part is the impellor. Since no check valve, reverse valve or any other kind of valve is present in the pump or pipe, other than the stop cock, the usual valve troubles are eliminated.

Easily attached to any machine. **Insist that the new machines you buy be equipped with the "FULFLO."**

The Cincinnati Lubricant Pump Co.

126 Opera Place Cincinnati, U.S.A.

Determine, Measure and Eliminate

LOST TIME and MOTION

Master Cronograph

The day of advanced prices only for the purpose of advanced profits has now passed.

To "economize" on selling expense may be "to save yourself into bankruptcy."

The one opportunity for the manufacturer to increase his profits is by a reduction of costs.

Labor in America will never sell itself cheaper than to-day, and the cost of materials is increasing yearly.

Therefore, increased profits in your plant are dependent upon just one thing:

You must determine, measure and eliminate lost time and motion.

The Master Cronograph will enable you to determine without further calculation just what a man or a machine DOES DO and SHOULD DO in an hour or a minute.

With such information, you may **STANDARDIZE** the operation—**INSTRUCT** your men to a more profitable effort and **MEASURE** their work in terms of the new standard—thus extracting from your present conditions an added profit without the expenditure of an extra dollar.

The Master Cronograph is the one device which will show at a single rating the total of its computation. The only stop watch that will reduce net time to output or production per hour without the use of a pencil. It embodies a 17-jewel time-piece. Write for literature.

CANADIAN MACHINERY

AND MANUFACTURING NEWS

A weekly newspaper devoted to the machinery and manufacturing interests.

Vol. XVI. TORONTO, NOVEMBER 2, 1916 No. 18

EDITORIAL CONTENTS

Galt Machine Screw Co.; Its Plant Equipment and Product 459-463

General 463-464
Canada's Fire Loss a National Handicap....Death of Capt. F. R. Newman .... B. C. Lumber Output.

Production Methods and Devices 465-467
Weight Adjusting Gauge for Shells....Belt Shifter Trouble....Straightening Small Perforating Punches....Rough but Serviceable Grinder....Protecting Tumbling Barrels....A Screw Machine Tool....Moulding an Angle Iron Former Casting Without a Pattern .... Drill Jig for Small Shells.

General 467
The Cost of Munitions.

Machine Shop Equipment, Methods and Processes—III 468-470

General 470
Official Badge for Women Workers.

Editorial Correspondence 471-473
Cultivating Initiative....Recognition of Ability....Working With a Purpose .... Organization and System.

Progress in New Equipment 474-477
Geared Head for Screw Machines....Motor-Driven Four-Plunger Horizontal Hydraulic Pump....Special Lathe with Thread Milling Attachment....New Model Little Tugger Hoist....Threading Machine for Hollow Set Screws....Flexible Shaft Equipment.

General 477
Recovering Tin from Scrap....Davies Shipbuilding Co. Changes....Grand Trunk Railway System Anniversary....Detention Extraordinary.

Editorial 478
General Business, Shipping and Shipbuilding....Enemy Samples Exhibition....Cost and Value of Trade and Technical Papers.

Industrial Notabilities 479
James Thomas Cumming.

Selected Market Quotations 480-482

The General Market Conditions and Tendencies 482-486
Montreal Letter....Toronto Letter....Canada's Trade Shows Huge Increase....Britain Should Seek Our Trade....Canadian Trade with Foreign Countries....Empire Trade Bank Proposed.

Industrial and Construction News (Advertising Section) 80-87

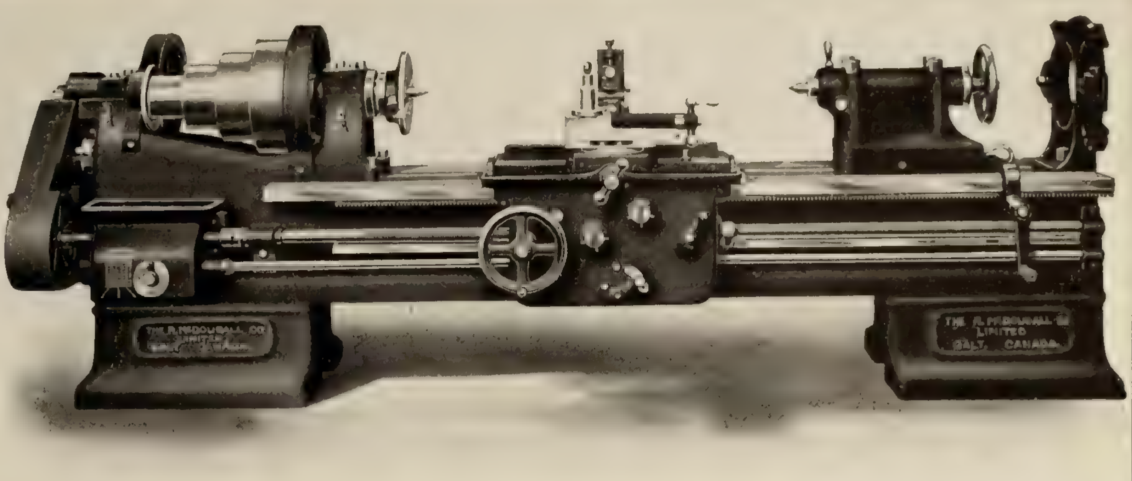
McDougall Lathes for Big Production

16, 18, 20, 22 and 26 inch Swing.



ARE-MAC-DEE IS A GUARANTEE

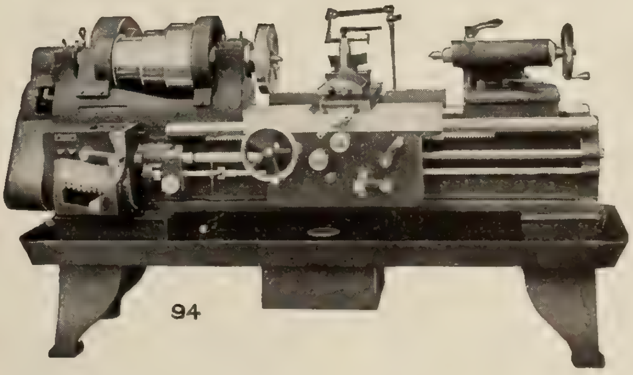
Big Shells require Lathes which are built to stand the strain of high speed production.

McDOUGALL Lathes are built right and of the best materials. They will easily handle any thing up to the limits of their rated capacity.

Furnished with all the regular attachments of modern machine tool practice.

The R. McDougall Company, Limited
Manufacturers
GALT, Ont., Canada
The Canadian Fairbanks-Morse Co., Limited, Sales Agents.

In Stock for Immediate Delivery



1 No. 2 Brown & Sharpe Plain Milling Machine.
1 16" Ohio Back geared Shaper.
1 Garvin Hand Surface Grinder.
1 No. 2 Diamond Surface Grinder.
1 Style B. Yankee Drill Grinder.
1 Style B.X. Wilmarth & Morman Cutter, reamer and drill grinder.
1 No. 1 Sipp Ball bearing drill press.
[illegible] 20" Back geared drill presses.
[illegible] 14" Single spindle sensitive drill presses.
1 14" Two-spindle sensitive drill press.
2 16" Three spindle sensitive drill presses.
2 16" Four spindle sensitive drill presses.
1 13" x 5' Lancaster screw cutting lathe.
1 2½ x 26" Greenlee flat turret lathe.
2 21 x 8 Roulsted heavy type turret lathe for 4.5 and 6" shells.
1 36" x 14' 0" Conradson Turret lathe, three-step cone, triple back-geared for 6" and 9" shells.
1 18" x 8" Flather engine lathe, quick-change gear, four-step cone, draw in attachment and collets.
1 18 x 12 American engine lathe, quick-change gear, five-step cone, single back gear and compound rest.
1 26 x 10 Bradford engine lathe, 5-step cone, single back gear, chuck and taper attachment.
[illegible] 28 x 16 Lodge & Davis lathe, quick-change gear, five-step cone, single back gear.
1 16 x 8 South Bend lathe.
[illegible] [illegible] x 8 Blakeslee single purpose, heavy duty lathe for turning 6" shells.
1 16 x 8 Prentise all geared head turret lathe.
1 20 x 8 C.M.C. turret lathe, 3 step cone.
1 17 x 8 Sidney Lathe quick change gear, 3 step cone double back gear.
1 18½ x 8 Cincinnati lathe, 3-step cone, double back gear and quick-change gear.

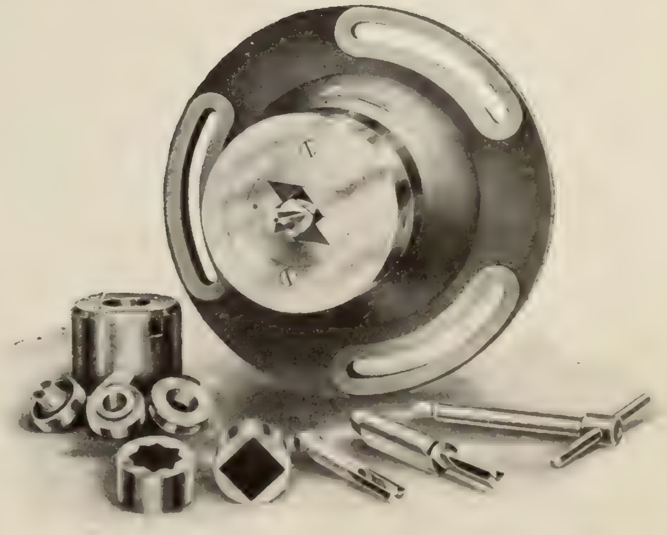
RADBORE HEAD

Drills Accurate Square Holes For Every Class of Work

Radbore Heads will drill square holes through the material or they will drill square holes to any desired depth with perfectly flat bottoms! Once in your shop the uses that spring up for this head will be remarkable.

THE RADBORE HEAD HAS SEEN CONSTANT SERVICE FOR TWO YEARS! ∴ ∴



Maximum Accuracy—Minimum Cost

The Radbore Booklet will throw some interesting facts on your work. Write for a free copy now.

AIKENHEAD HARDWARE LIMITED

17 TEMPERANCE STREET, TORONTO

WHY P. & W. Taps WIN

It's in the Design

One-third of the land from the cutting edge is concentric.

The remaining two-thirds has eccentric relief.

The taper-tap has a cylindrical pilot.

The taper and plug-taps have an eccentrically-relieved chamfer relieved clear from the cutting edge. The highest grade of steel obtainable is used.

What it Means to You

Taps can be sharpened at the only correct point—on the face of the cutting edge.

Sharpening in no way affects their size.

Can be sharpened long after other so-called eccentrically relieved taps are rendered useless.

We obtain the freest cutting tap with the longest life —an exclusive combination.

Accuracy nowhere else obtainable is secured together with a degree of finish and refinement heretofore thought impossible with a commercial tool.

For a number of years we have made taps with this style of relief. They have won out steadily and consistently on merit alone.

The Tap with the

TORONTO **November 9, 1916**

Concerning An Experience

A YEAR or so ago a certain advertiser in this journal was fortunate enough to secure one of our front covers. For a long while he could not be "sold" on advertising. It was a good thing—an uncommonly good thing—for any line but his. But, in his case, while it wouldn't exactly be throwing the money away he insinuated that, at least, it would be investing it in a rather poor proposition. Finally, good arguments, good patience and good judgment prevailed and a front cover announcement was made. The effect was mutually gratifying. The man was permanently sold, and entered upon a contract for regular space with what might be termed (in the light of his former skepticism) as genuine enthusiasm, real "honest to goodness" gusto. In his eagerness he seemed to be trying to make up for lost time and lost opportunities.

We have had on our files for several months a contract for several of our 1917 covers for this advertiser, and his regular space is steadily growing in size.

Now this advertiser, by virtue of the direct results he secured, was made an everlasting convert to advertising. He told us about replies he had received, about the visits to his office, and about steadily increasing sales. But he doesn't know, and we don't know, and nobody knows or can estimate the full force of this man's advertising. For instance, we heard in a rather direct way not long ago that a competitor really felt the effect of the advertising as much as the advertiser himself did!—only the competitor felt it adversely. See the point?

If your competitor advertises and you don't, you may not be exactly bound and gagged, but there will certainly be a noticeable impediment in your speech. If you advertise and your competitor doesn't—well, he should worry.

And if you both advertise you will both benefit because there are enough benefits to go around. If you can sell your line by word of mouth you can sell with advertising and sell with less effort and with greater profits. Moreover, your name will be impressed indelibly on the minds of buyers, both present and future.

Cyrus Curtis says "It pays to advertise because it does." Cyrus Curtis charges as much for one back cover of The Saturday Evening Post, as we charge for one hundred front covers of Canadian Machinery, and successful national advertisers line up for Post back covers like patrons at a nickel show extraordinary—waiting to get in! And if they can't get a box seat they sit with the crowd and enjoy themselves just the same. That's the spirit of the advertiser who knows advertising pays!

(Canadian Machinery has no back covers open and only three front covers for 1917 are available. They will be sold only to advertisers using regular space inside.)

Quality **Service**

Courtesy in Business

* * *

Fittingly framed and hanging in the Offices of one of the most important Public Service Corporations on this North American Continent is the following

> **'Did you say Please and Thank you?'**

Broad minded men direct the destiny of that Corporation, men who know that public or private enterprises to be lastingly successful must operate for the public good.

Quality and Service are the two important factors in our business life today, but Courtesy is the door through which they must enter.

We are large producers of Hamilton Pig Iron and our output of Open Hearth Steel Blooms and Billets, Iron and Steel Bars of all shapes and size runs into enormous tonnage.

The products of our mills include practically everything that can be manufactured from Iron and Steel and these we distribute to thousands of satisfied customers.

Our business is an extensive one and a successful one. The World is our market: but our prosperity and success in the future, as in the past, depend upon the continued confidence, co-operation and good-will of the people we serve.

STEEL

for

SHRAPNEL SHELLS

AND SHELL BLANKS

Only Company in Canada producing steel ingots by the "HARMET" Liquid Process.

REASONS WHY THESE INGOTS ARE SUPERIOR TO THE ORDINARY KIND:

1. Prevention of cracks, due to shrinkage; of internal stresses and resulting cracks and fissures.
2. Early cessation in the crystallization of the metal, and the production of fine crystallization of the metal, without cleavage planes.
3. Lessening of segregation, i.e., reduction of tendency to carbon and other impurities to concentrate in the central and upper parts of the ingot.
4. Prevention of "Pipes" or interior cavities, and thus preservation of absolute solidity in the ingot.
5. Improvement in physical properties.
6. Reduction in waste of ingot.

WE CAN SUPPLY FORGINGS OF ALL SHAPES AND SIZES MADE OF ORDINARY OR "HARMET" FLUID COMPRESSED OPEN-HEARTH STEEL ON THE SHORTEST NOTICE.

For Turning, Facing and Milling the thread on Gas Check Plugs for 6-inch High Explosive Shells.

THE BANFIELD PLUG MILLER

Patents applied for in Canada and United States

THIS machine is especially designed for finishing base plugs, turning the outside diameter, finishing the face with any camber desired, and milling the thread, all in one chucking, the complete plug being finished in six minutes by unskilled labor.

The machine is equipped with quick draw in collet. Drive pulley 18" x 6", with bronze bush having cut jaw clutch for turning and facing. Worm gear 100 to 1 ratio, with cut jaw clutch for milling. driven by 10" x 1½" flanged pulley. The milling cutter is driven by an 8" x 2½" flanged pulley. Tool post carriage is equipped with power feed (two speeds) having automatic stop. Power feed pump with relief valve driven from worm shaft **(all drives direct from main line shaft).** Rigidly built, simple and economical to operate.

Weight 1,800 lbs.

For 18 pdr., 4.5 and 60 pdr. High Explosive Shells, Can furnish machines of same type, but somewhat lighter in construction. Particulars on request.

These machines are tooled up for finishing plain machined plugs if desired.

Write for prices and deliveries.

PETRIE

20-inch Heavy Duty Manufacturing Lathe

DESIGNED AND BUILT ESPECIALLY FOR MACHINING HIGH EXPLOSIVE AND SHRAPNEL SHELLS UP TO AND INCLUDING 8-INCH. USED AND ENDORSED BY SOME OF THE LARGEST AND MOST SUCCESSFUL SHELL MANUFACTURERS.

DESCRIPTION

HEADSTOCK—All Headstock journals are provided with well lubricated, renewable bronze bearings.

Alternate heat treated steel and bronze washers take the end thrust and a simple adjustment is provided to take up wear.

All gears are covered with neat and substantial cast iron guards that may be quickly removed when desired.

BED—The Bed is of deep construction and width to give the greatest rigidity under heavy cuts.

The shears are made extremely massive and the bed walls extra thick, providing the necessary mass of metal to absorb the vibration and shocks incident to heavy turning at high speeds.

Heavy box girths tie the front and rear walls of the bed together at close intervals.

Improved type wide angle V on front shear to take thrust of cutting tool.

The rear bearing of carriage on bed is flat instead of V-shaped.

At the rear of the bed planed pads are provided for attaching Taper and Forming Attachments.

CARRIAGE—The bridge is very wide and extraordinarily deep; it will not spring under the heaviest cuts.

The carriage is gibbed to the bed at the rear on the outside and will not lift under any conditions.

APRON—The apron is of heavy double plate type affording a support or bearing to both ends of all shafts.

Apron is tongued and grooved to the carriage, also bolted and dowelled.

The feed friction has a greatly increased diameter and will pull the heaviest feeds and cuts without slipping.

For engaging the friction a hand wheel several inches in diameter is provided and seats the friction firmly with very small effort on the part of the operator.

All studs in apron revolve and simple but adequate oiling facilities are provided.

FEEDS—Positive Gear drive through headstock spindle steel gears in gear box, three rates of feed are provided for through sliding key type. Feeds per revolution of spindle being ⅛ in., 1-16 in. and 1-32 in.

All gears in the feed train are fully guarded.

TAILSTOCK—The tailstock is a massive casting, rigidly braced internally, and is provided with a long nose, making it unnecessary to extend the tailstock spindle for ordinary work.

It is clamped to the bed by four large locking bolts operated at the top of the barrel.

A simple binder locks the tailstock spindle in correct alignment, this clamp is located at the extreme front end where it grips the spindle with the utmost rigidity and absolutely does away with distortion of any kind.

The screw is unusually large to resist any buckling tendency.

Suitable screws are provided for setting over for Taper Work.

EQUIPMENT—Unless otherwise specified Lathes are furnished with 8 ft. bed, one driving plate, hand cross feed, heavy duty plain rest, necessary wrenches, and two speed tight and loose countershaft.

Forming attachment, turret tool post, hand or power feed bed turret, oil pan, pump, and connections can be furnished as extras when desired.

DIMENSIONS

Swing over bed	20 in.	Width of Tool Slide	12 in.
Swing over carriage	11 in.	Diameter of Headstock Cones	11 in. and 14 in.

Machining High-Carbon Steel with a Connecticut

THE Connecticut Lathe illustrated below is for the machining of high-carbon steel at maximum speed—this lathe combines power, accuracy and rigidity in fullest measure.

The bed is cross ribbed with heavy box shaped girths 15 inches apart. All gears and pinions are of steel except the big gear, which is semi-steel with 4-inch face. The head stock, the tailstock—every detail from pulley to base—are built to the most liberal dimensions. The utmost power is built right into Connecticut Lathes.

HEPBURN LATHES

for

Speed
Accuracy
Power

Simplicity
Strength
Design

Here is a heavy duty Shell Lathe that saves its price. This has been demonstrated in factories in which a Hepburn and other makes have stood side by side doing the identical work. The Hepburn by reason of its SPEED, ACCURACY, RIGIDITY, STRENGTH and SIMPLICITY gives a better output than many lathes of lesser worth, and when outputs are reckoned the Hepburn is found to be a money-saver which means that ultimately its cost becomes wiped out.

We want to prove this advertisement with documentary evidence. Will you put it up to us to make good our statement.

We make turret and turning lathes up to and including 9.2″.

John T. Hepburn, Limited
18 to 60 Van Horne St.
Toronto, Canada

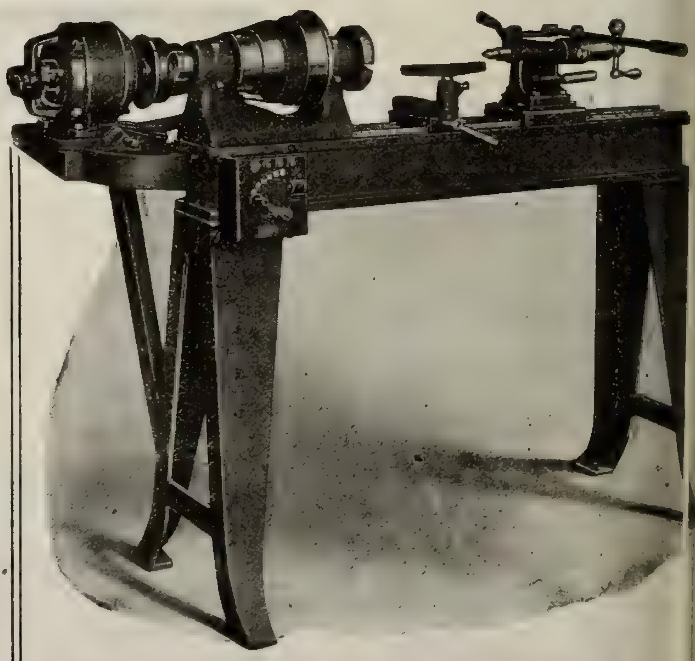
Manufacturers of the "STENO" Duplex Surface Grinder
The "STENO" 1 in. x 7 in. Turret Hand Screw Machine and
"STENO" Milling Cutters Reamers, Fixtures, Jigs and Gauges.



Motor Driven Speed Lathe

This style of motor drive employs a constant speed motor mounted on plate having an extension arm to support a bearing for the outer end of th motor shaft. The motor plate is fitted to a slide on a shelf which is securel fastened to the back of the lathe bed. The motor plate is moved by mean of a screw which tightens or loosens the belt. A four-step cone pulley o the motor shaft is belted to a four-step cone pulley on the spindle. Thi gives the same speed variation as when a countershaft is used, and by mean of various size cones on the motor a wide range of speeds are obtainable.

The lathe spindle is made from high carbon steel, ground to size, an running in self-oiling bronze bearings. The tailstock has screw and leve feed. The bed is crossed-braced and all clamping levers are above the way

J. G. BLOUNT CO. - Everett, Mass., U.S.A

Two Cuts at One Time

The ability to face, undercut or neck with the square turret while boring or turning with the hollow-hexagon turret contributes largely to the time-saving and economical output of the

Universal Hollow-Hexagon Turret Lathes

Separate feed shafts, each with ten individual feeds, operate the carriage and turret saddle independently, and provide the exact feed required for each.

And to this great advantage are added the other essentials for rapid and accurate production—excess power, extreme rigidity, great adaptability, and a power rapid traverse that saves time and conserves the energy of the operator.

Without obligation, ask us to show the saving on one of your typical jobs. Send blueprints with rough and finished samples.

Gardner Grinders

Illustration shows a grinder developed especially for removing the hub or centre projection from the ends of shells. This machine is also used for cutting off the square or angular hubs from High Explosive Shell Base Plates. We build a much more powerful grinder to be used for these same operations on 6-inch shells.

Features:

High-grade Babbitt Bearings and Lever Feed.

Rapid clamping of Shell into "V" fixture.

Pump and water system driven from countershaft directs the water or grinding compound at point of grinding contact.

Can be equipped and operated at both ends for double output.

Output, according to size of projection to be removed from 40 to 100 per hour. Equipment includes two 16" Perfection chucks, two 16" abrasive ring wheels, two semi-universal lever-feed work tables, two shell-holding fixtures, water and pump, with connections; countershaft and usual attachments. Weight, 4,500 lbs.

Elmes Hydraulic Press No. 676

With ¾-in. Automatic Lever Operating Valve No. 677-A

This press is of steel and semi-steel construction, and the stands which support the press are threaded at the ends to receive the steel columns and have holes for fastening to the floor. The platen is guided by the columns.

The operating valve is attached to the cylinder, and is designed with a weight to be set for the pressure desired, and releases automatically. To start the ram up, the lever is pushed down; upon the ram reaching the desired pressure, the lever automatically releases (acting as a safety valve as well), causing the ram to descend. Valve body is made of bronze, and other parts are made of tool steel and machine steel. If desired a hydraulic gauge can be attached to show the various pressures, although with this valve it is not necessary.

Write for our Hydraulic Machinery Catalogue.

More than five times as efficient as direct radiation.
Much lower in first cost, in upkeep and operation costs.
Perfect distribution and diffusion of heat; no overheating.
Provides economically, rightly tempered air.
These are some of the reasons why "Canadian" apparatus will serve you best.
HEATING AND VENTILATING OF INDUSTRIAL PLANTS shows the many advantages of the "Canadian" Fan System. Ask for Catalogue No. 198-16.

ACCURACY

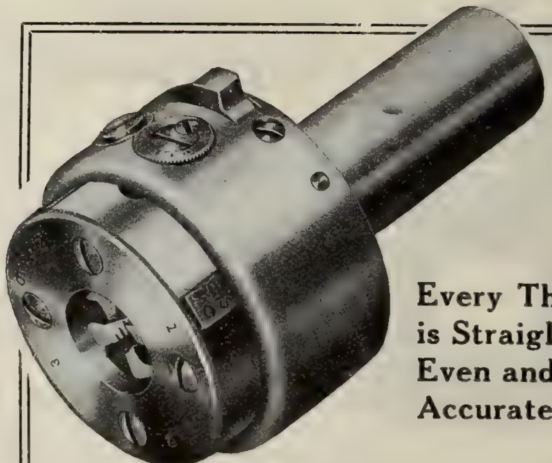
Good screws must have good threads—in both fit and finish.

When nuts are added and drawn up tight, the contact is even. **"GALT"** Cap and Set Screws are always accurate.

Specialists in Cap and Set Screws.

THE
GALT MACHINE SCREW CO.,
LIMITED
GALT, ONTARIO

Eastern Representatives: The Canadian B. K. Morton Company, Limited, 49 Common St., Montreal Que.



Every Thread is Straight, Even and Accurate

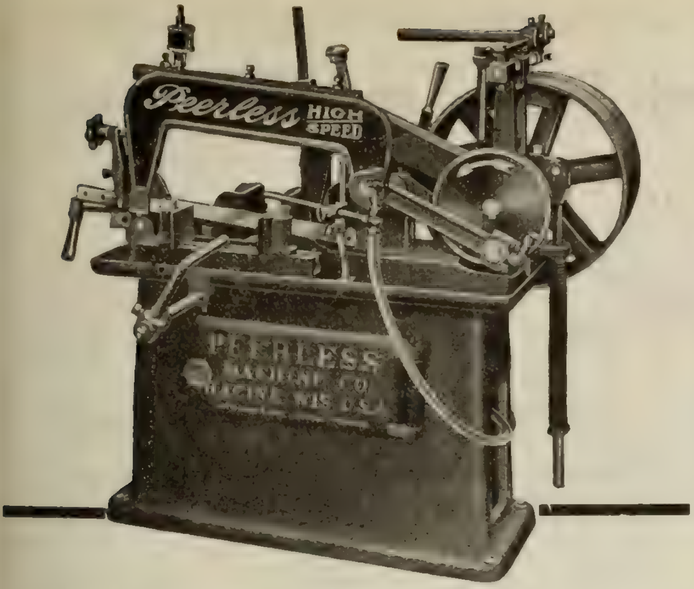
The Chasers in an **H & G Automatic, Self-Opening Die Head** are set and held in place by a steel cam. That cam once adjusted, locks; there is no stoppage or changing in size.

The quick release not only issues the cutting of the thread to a given point every time, but permits cutting right up to a shoulder when required.

Simple, Strong and Compact.

Our booklet tells more. Drop a card for it.

Eastern Machine Screw Corp.
New Haven, Conn.



"100% Better, Faster and More Reliable

than any Sawing Machine we have ever used; we have had almost all makes of Sawing Machines manufactured."

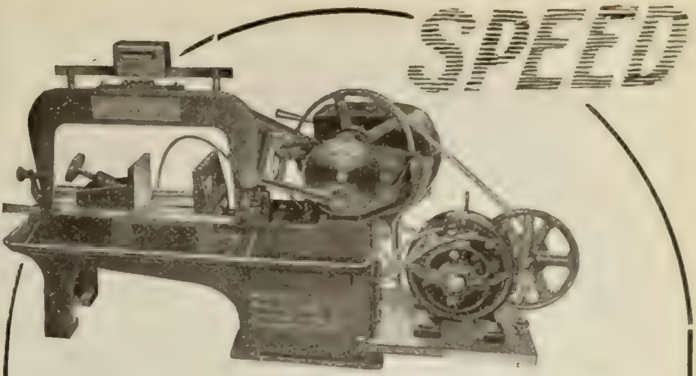
Just what a customer in Toledo, Ohio, reports after a thirty days' trial.

You don't have to take anybody's word for it, try it out under your own conditions. You are under no obligations if it fails—remember we also pay the freight both ways.

Not only 100% more production, but saves 100% floor space. These problems have handicapped many manufacturers for some time. They can now readily be solved by the Peerless High Speed Heavy Duty Metal Cutting Saw.

Write us for complete description and references. Some of these machines may be working in your vicinity.

Peerless Machine Co., 1607 Racine St., Racine, Wis.



and a clean, straight cut

If you're interested in speed and accuracy you'll be interested in the

Racine Metal Cutter

It goes through angle irons, channels, I-beams, die blocks, pipe, tubing, heavy bars, etc., in a way that wins the enthusiastic endorsement of all users. It is in use in many Canadian shops. One Canadian Steel Company purchased 120 Racine Metal Cutters and has effected a saving of $11,019.50, full particulars of which will be given interested parties.

Write for list of Canadian users, and specifications.

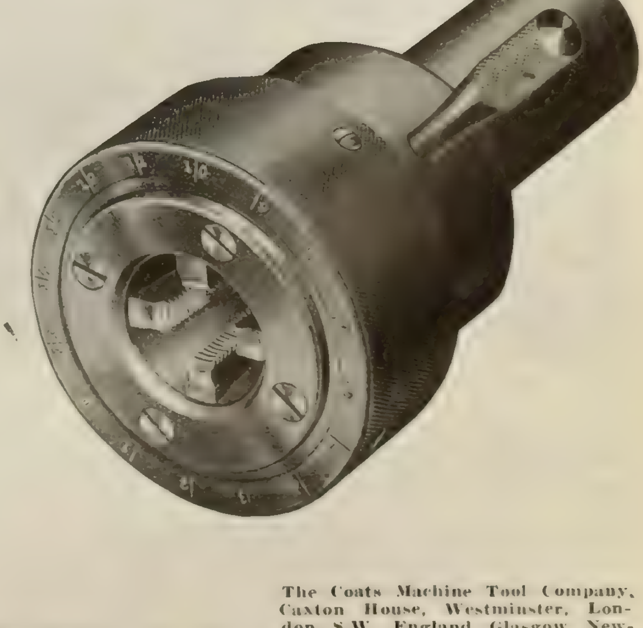
Racine Tool & Machine Co.

15 Melbourne Ave., Racine, Wisconsin, U.S.A.

MURCHEY TAPS AND DIES

Very extensively used on 6-inch, 8-inch and 9.2-inch shells

MAKERS ARE finding that Murchey Collapsing Taps and Automatic Self-Opening Dies are paying propositions on this kind of work. We can tap any size hole from 1 inch to 12 inches. All chasers used on shell work absolutely guaranteed to be made of the highest grade of high-speed steel. Get the benefit of our experience and the experience of some of the biggest shell manufacturers in the country. Let us tell you about the savings. Send blueprints. Write to-day for catalog.



Murchey Machine & Tool Company

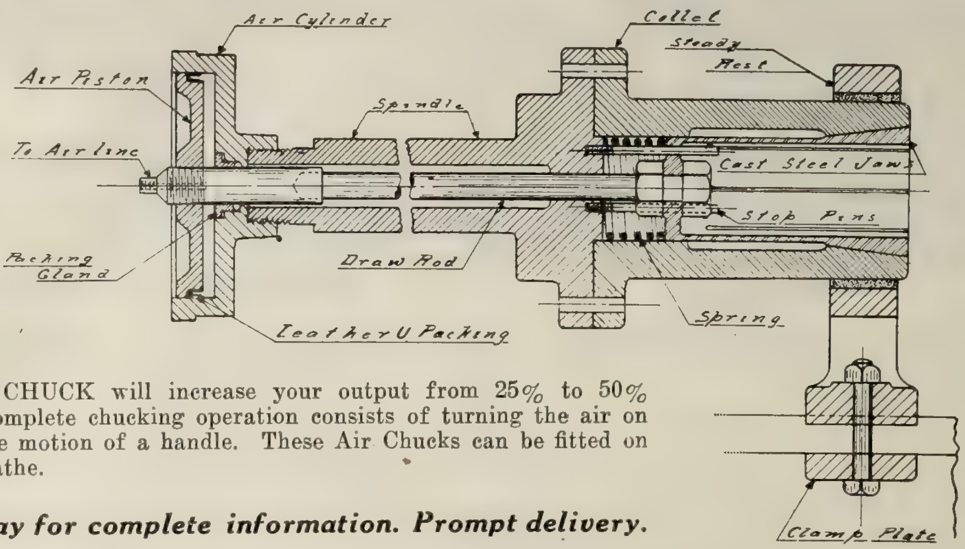
Get Out Your Watch and Time Your Chucking

With most screw chucks you have to use brute force or the hammer to tighten, and even then your shell is not always rigid.

H.E.W. AIR COLLET CHUCK IS RIGID

Saves Time

Saves Money



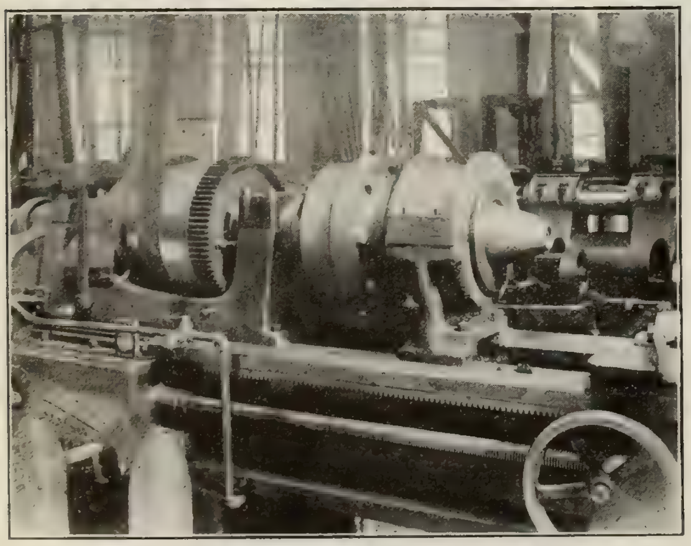
H.E.W. AIR CHUCK will increase your output from 25% to 50% because the complete chucking operation consists of turning the air on and off, by the motion of a handle. These Air Chucks can be fitted on almost any Lathe.

Write to-day for complete information. Prompt delivery.

HYDE ENGINEERING WORKS

P.O. BOX 1164

27 William St., MONTREAL



Cut shows Chuck on nosing operation. This is one of over two hundred in this Canadian plant.

This chuck is *built on the duplicate part system. It is simple, effective and fool-proof.*

It grips the shell in a predetermined position. The jaws will not slip on the shell. It has shell interior and exterior adjustable stops.

A trial on one of your lathes will convince you that this is THE Chuck for shell work.

A Big Efficiency Unit in Your Shell Plant

A. J. LAVOIE'S

LOW PRESSURE

Compressed Air Chuck

This chuck can be applied to any make of lathe, without alteration to the machine, and will increase production from 25% to 75%. It grips and releases the shell while in motion—no need to stop your machine.

It is a single unit combination attached to the face plate of lathe, supported by an additional heavy duty bearing, thus making a heavy duty lathe out of a light machine. A small lever operates the chuck. Will operate with a pressure of 60 lbs. per sq. in.

MANUFACTURED BY

The Montreal General Tool Co.

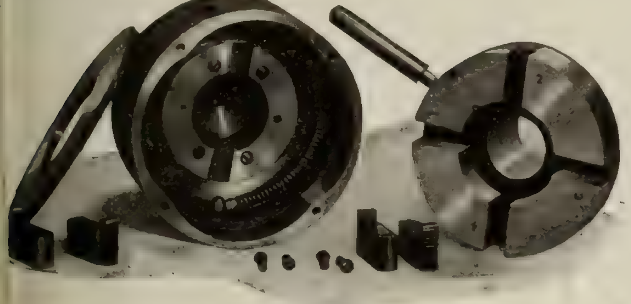
673-5 Notre Dame Street, Maisonneuve, Montreal, P.Q

Also manufacturers of shell tools, and special machine attachments of all kinds made to order.

The "IDEAL" Die for Shrapnel

Quick, accurate work in threading Fuse Plugs for Shrapnel Shells is essential if you would make maximum profits. Your ield is unlimited and your output gov-rns your income. **Why not give the special type "C" Ideal Die a hard trial at this work and see if it will not boost production for you?**

Let the "IDEAL" cut the threads that bind you to low production. They will fit your machines. Circular on request.



"IDEAL" is a *different* die. The head revolves around a stationary cam, thereby utilizing the belt power or cutting strain as opening power. Chasers are supported directly back of cutting strain, which will remove any tendency to bell out and cause taper threads.

The Ideal Tool & Mfg. Company

READY TO SAVE YOU TIME

Why waste time turning and boring tubular shapes from solid stock? You wouldn't forge or machine merchant bars, because it wouldn't pay. And it doesn't pay to bore out bushings, or collars, or lathe-spindles, or several hundred other tubular articles, because Shelby Seamless Steel Tubing can be procured in almost countless sizes and thicknesses, hard, medium, or soft, and in almost any length, READY for use, and cheaper than you can make an equivalent form in your own shop.

The WORKABILITY of Shelby Cold Drawn Tubing is remarkable: it is surprisingly tough and ductile, otherwise it could not be drawn cold. It is capable of many different anneals, and can be case-hardened. It machines readily, takes an excellent polish, can be brass or copper-plated, nickeled or oxidized, and withal is made in so many different sizes and thicknesses that it is simply old-fashioned and wasteful to neglect its many advantages.

Examine the range of sizes shown in this small group; think of the wasted labor in attempting to duplicate sections of these in a machine-shop and finally compare prices which we quote on application.

We have the ONLY STOCK in Canada of

SHELBY SEAMLESS STEEL TUBING

Over 350 sizes—⅛ to 5½ inches O.D.

Economy of time, labor and materials is the keynote of manufacturing profits.

In the development of power, transmission, selection of machinery, it is of the utmost importance to secure the greatest output of work.

Even in the selection of your small tool equipment, the greatest care must be used. Remember, it is not drills, but holes, that you are buying. The same applies to every tool that you buy.

The Fairbanks-Morse line of small tools includes everything necessary to equip the most complete plant.

Every tool has been selected after it has proven its ability to make good.

Secure our prices before placing your order.

Machining the 4.5 in. Mark V. Howitzer Shell

Staff Article

Shell production in a variety size and type continues to monopolize the activities of Canadian metal-working plants, large and small, and indications are not lacking that for many months to come this state of affairs is likely to prevail. Experience in the field has, as was to be expected, led to developments in projectile design, and this in turn has given increased opportunity and scope for the exercise of greater operative skill and ingenuity.

ALTHOUGH 4.5 in. high explosive shells have been manufactured in this country for over a year, the methods now in use at the various plants are not in all cases the same as originally adopted. During the intervening period experience has taught many lessons, and methods of manufacture have consequently improved. The necessity of increased production has been the chief inspiration for greater effort and inventive genius. New ideas have been evolved, and many of the operations simplified. Since the manufacture of 18-pdr. high explosive shells was abandoned, many plants have been changed over to the production of 4.5 in., while others have been specially equipped for producing this type of shell. The plant which is the subject of this article comes within the latter category.

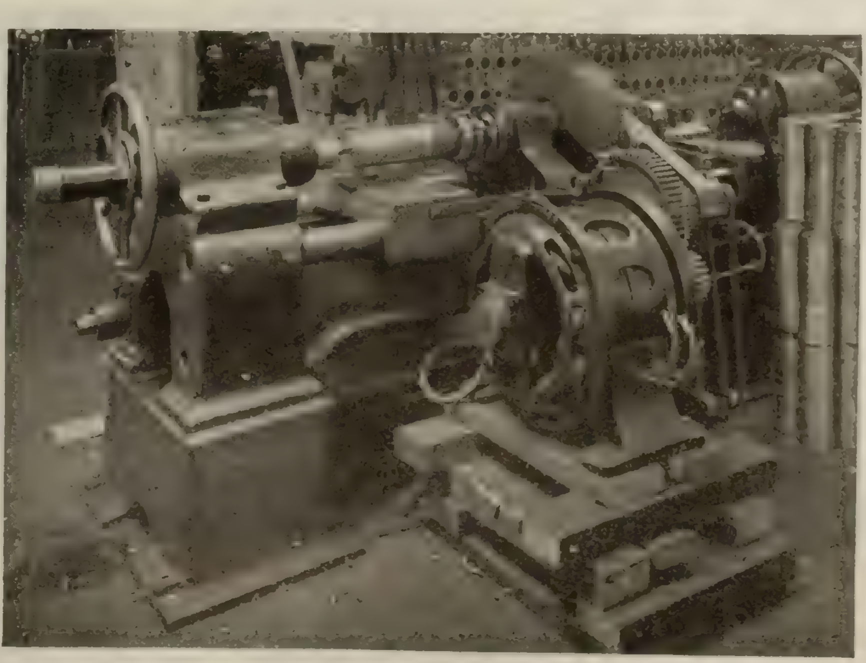
The 4.5 inch high explosive or howitzer shell is made from a forging 4.8 inches diameter and not less than 13¾ ins. long. The steel billet from which the forging is formed is also 4.8 ins. diameters, but only 11½ ins. long, and weighing 49 pounds. The forging is, of course, hollow and the sides parallel. The weight of the finished shell is 35 pounds, including the bursting charge (T.N.T.) of 4 pounds. As in all shells, the finished weight must be within fine limits, the latitude allowed on the 4.5 in. shell being plus or minus 9 drams. This being the case, great care has to be exercised during all operations involving the removal of metal, and this calls for careful inspection in order to catch any error at the completion of each operation. A good method adopted in order to simplify the weight adjustment, and one which is used at this plant, is to leave the base, during the earlier operations, a little in excess of the high limit, so that any extra weight can be removed from the base if the walls of the shell happen to be too heavy. Comparatively little metal has, however, to be removed from the base, and enough to ensure the weight being within the prescribed limits.

Cutting Off and Centering

The first operation consists of cutting off the open end of the forging to an appropriate length, this being followed by facing up the base. Both of these operations consist of roughing cuts done on the same type of machine, and do not call for special mention. Three cutting-off machines are installed for the purpose, two being of Martin Pump & Machine Co., Toronto, make, and one by John H. Hall & Son, Brantford, Ont. Centering the base is done at the third operation. This centre is retained in the shell through all the various operations until the base recess is formed. This is done to ensure that the walls of the shell are concentric, a feature in the manufacture that has to be carefully watched. The centering operation is done on a vertical drill fitted with a jig holding the forging steady and locating the countersink drill in the correct position. The jig has a vertical mandril for holding the forging, while on the top is a hinged plate, which rests on the base of forging, having a hole for guiding the drill.

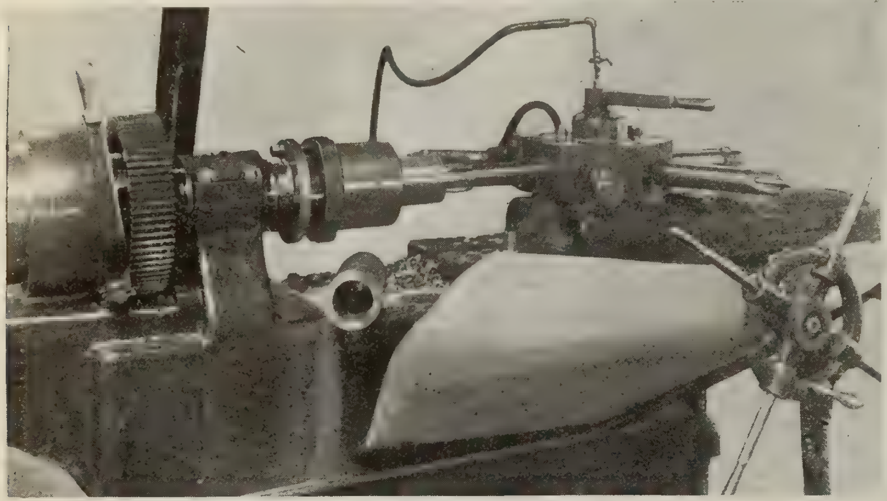
Rough Turning Outside Diameter

The fourth operation is rough turning the outside diameter of forging. For this work two lathes by the Dunlap Mfg. Co., Columbus, Ohio, are installed, and also a special single purpose lathe supplied by the Dominion Machinery Co., Toronto. In the former lathes, the forging is held on an expanding



ROUGH TURNING SHELL BODY ON "DOMINION DUPLEX LATHE.

mandril fitted with a draw-back mechanism operated by a hand wheel. The base is held by the centre in the tailstock. One complete roughing cut is made, followed by another cut from the base for rather more than half the length of the shell. The body of the rough turned shell has now two diameters, the half of the shell next the base having enough metal left for a finishing cut at a later stage, while the other half of the shell is left somewhat larger so as to have a safe margin of stock to allow for any variation on the profile of the nose after nosing-in. The single purpose lathe mentioned above has a central headstock and two tailstocks, one on either side. At each side of the headstock is a clutch and chuck permitting either half of the lathe to operate independently of the other. The chuck is of special design, and has a square slot for driving the expanding mandril. The mandril consists of a series of rollers, which ride up on friction blocks inside the fixture, when it is revolved in one direction. When in operation, the tendency is for the rollers to be forced out, thus holding the shell firm. The lathe is motor-driven.



BOTTOMING AND BORING INSIDE DIAMETER OF SHELL.

Inside Bore Roughing and Finishing

Inside boring is the next operation, one "Davis" turret lathe and four boring machines, built by the Martin Pump & Machine Co., being installed for this purpose. Each machine has a three-jaw sleeve chuck fitted with a tightening device operated by a push rod in the headstock spindle by means of a hand wheel. The turret holds five tools. The first tool rough bores the straight part of shell, while the second is the first bottoming tool which roughs the inside of base. The third is the finish bottoming tool, while the fourth reams the bore, finishing the inside operations. The fifth tool faces up nose end of shell, the cut being regulated by a bar which comes up against the bottom of bore and so controls depth of cut.

Rough Facing Base and Hogging Nose

The base is now rough turned to a definite thickness in relation to the bottom of bore. This is done on a facing lathe built by the Martin Pump & Machine Co. The shell is held on an expanding mandril, while a carrier also helps to support the shell. The tool holder is a simple mechanism made for the purpose, and is mounted on a cross slide. At the seventh operation, the corner of the nose outside is turned off or hogged to facilitate the nosing-in operation. A machine similar to the above, and made by the same firm, is used. In this case the shell is held in a collet chuck built in the headstock. This type of chuck was designed and made by the Martin Pump & Machine Co., and is fitted to a number of machines which that same firm installed at this plant. The chuck is really part of the headstock and consists of a steel sleeve, parallel inside for holding the shell, but having the front part tapered on the outside. This part of the sleeve has a series of narrow slots which allow it to grip the shell when pushed forward into the circular cone-shaped casting attached to the lathe head. The push rod which forces the sleeve forward by means of a circular steel plate is operated by a hand-wheel at the end of the headstock.

Heating and Nosing-in

What might be termed the first series of operations have now been completed, and the shell is now ready for nosing-in. The shells are heated in a "Mecol" oil-fired furnace, built by the Mechanical Engineering Co., Montreal. Five shells can be heated at one time, about half the shell only being heated. The shells are placed in the holes, nose first, and remain there about one minute, when they are taken out, one at a time, and carried to the nosing press alongside. Draft for the furnace is supplied by a blower.

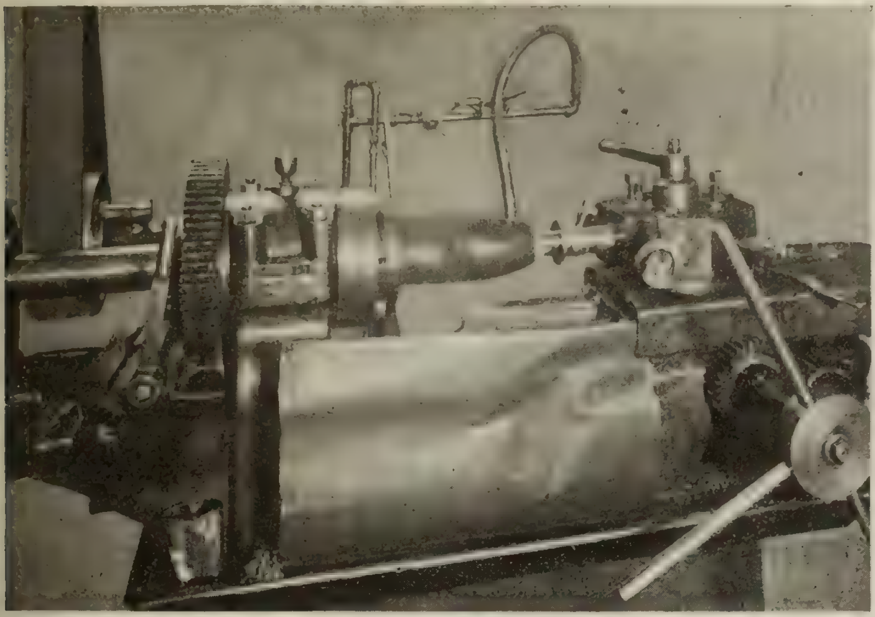
The hydraulic press was built by the William R. Perrin Co., Toronto, the power being obtained from a belt-driven vertical triplex pump supplied by the same firm. The die for closing in the nose is located in the top of the press, the shell being placed on the table above the ram and forced into the die. At the conclusion of this operation, the shell is placed nose down in powdered asbestos so that it may cool gradually, and not be too hard for the machining operations which follow.

Boring and Reaming Nose

After nosing-in, the shell is brought back to the machine shop for the next operation—the tenth—which consists of boring and reaming the nose preparatory to threading. A Martin Pump & Machine Co. turret lathe is used for this operation, the machine being equipped with a

"MECOL" FURNACE FOR HEATING SHELLS PREVIOUS TO NOSING-IN OPERATION.

collet chuck of the same type as has already been described. The tools are in the turret and the operations are performed in the following order:—Face nose with a cutter at the base of a gauge bar; bore nose with an ordinary boring bar and tool; rough ream, and finish ream.



SHELL NOSE THREADING AND FUSE SEAT FORMING ON "MARTIN" TURRET LATHE.

Inside Profile

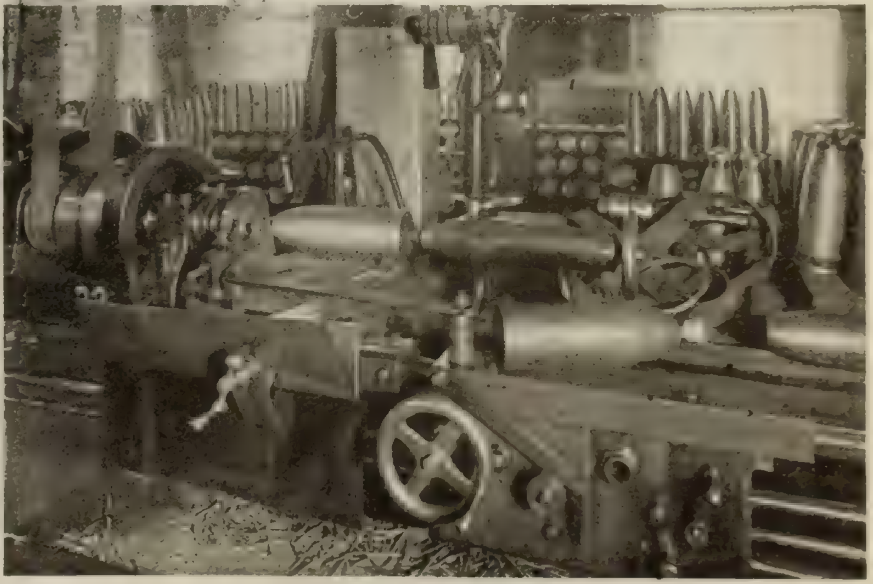
The eleventh operation consists of forming the inside profile, which is that part of the nose at the back of the thread. The profiling is done on a similar machine to that in the previous operation and made by the same firm. The turret, however, is removed, a bracket mounted on the saddle for holding the tool being substituted. The tool or cutter is of such a shape so as to form the correct profile. It is fixed to a bar and fed through into the nose by hand, and brought in contact with the inside of shell. The shell is next taken to an adjoining machine to have the nose threads cut.

Threading Nose and Forming Bevel

The twelfth operation is threading the nose and forming the bevel or fuse seat. This operation is done on a Martin Pump & Machine Co. turret lathe fitted with their standard collet chuck. The turret has four tools—a reamer, a cutter for forming the bevel, and two "Murchey" collapsible taps. The reamer is not always used, as the hole has been reamed at an earlier stage. As a general rule, the bevel is first formed, followed by the first tapping, the second tap being run through afterwards.

Finish Turning Outside Diameter

The thirteenth operation is finish turning the outside diameter, including the outside profile. For this operation there are installed two engine lathes built by the Hamilton Machine Tool Co., Hamilton, Ohio, each lathe being fitted with a profiling fixture mounted on the carriage. A threaded centre with a square box which fits in the chuck is screwed into the shell nose, while the base is carried in the tailstock centre. The profiling fixture which carries the tool post is in the form of a quadrant, and is mounted pivoted to it at the back. The fixture is operated by means of the carriage and a bar attached to the first carriage and apron of the second carriage which is driven by the feed screw along the front of the lathe. The tool starts cutting at the nose end and travels in a curve to conform with the desired profile. The first carriage is stationary, while the second travelling along draws the fixture holding the tool part until it comes up against a stop. At this stage both carriages travel in unison, and the tool, therefore, moves in a direction parallel to the horizontal axis, finishing the straight part of the shell after the profile has been completed.



FINISH TURNING OUTSIDE DIAMETER OF SHELL ON "HAMILTON" ENGINE LATHE.

Rectifying and Trimming Base

At this stage of manufacture, the shells are carefully inspected and gauged for correct inside profile threads, etc. Sometimes slight errors are detected, which can be easily corrected, the operation being called rectifying. This is done on a Hamilton Machine Tool Co. engine lathe fitted with a turret containing a set of tools of the same type as have already been employed. After being gauged again, the shells move along to the next operation.

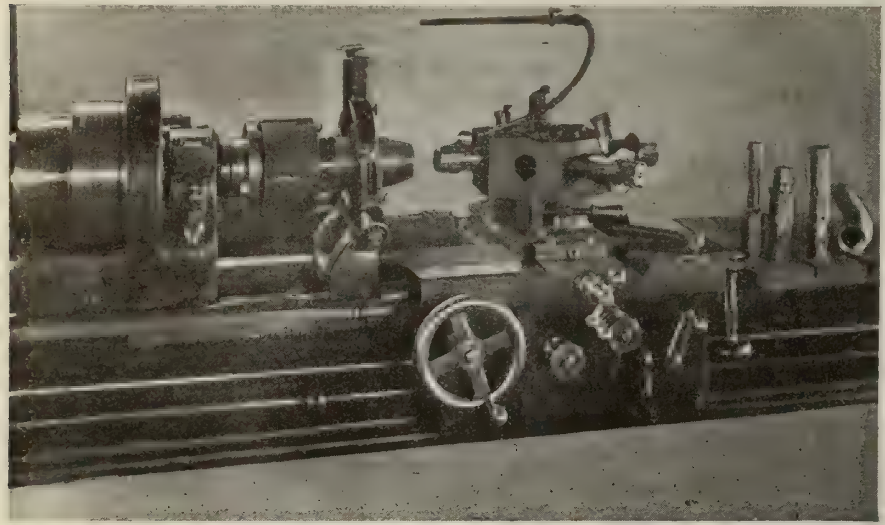
Facing or trimming the base to weight has already been referred to. The operation is performed on a Martin facing lathe, the same type of machine as used for facing up the base at the sixth operation.

Grooving and Waving

The fifteenth operation is cutting the groove for the copper band, waving and undercutting. Two machines are installed for this purpose, both fitted with a Martin waving attachment as shown in the illustration. The attachment is equipped with the usual three tools, grooving, undercutting, and waving, used in the order named. The waving tool is operated by a cam on the face of the chuck by means of a bar through the attachment. The bar is adjustable to locate the tool in the correct position; there is also a spring to keep the roller up against the cam. The attachment has a gauge to locate the grooving tool in the correct position in relation to the base of shell. The shell is held in the machine the same way as in the outside finishing operation. Three waves are cut for the 4.5 in. shell.

Machining and Threading Base Recess

There now follows a series of operations on the base which form a distinctive feature in the production of the smaller sizes of high explosive shells. These operations consist of roughing out the base recess, undercutting, threading, screwing in the base plate, and facing up the base. The first thing to be done is to form the recess on a Martin turret lathe. The shell is held in a collet cluck and is supported at the base end by a carrier. In the turret are two end mills for roughing and finishing the recess respectively.



RECTIFYING OPERATION ON INSIDE PROFILE, NOSE BEVEL, AND THREAD; HAMILTON ENGINE LATHE.

The next and seventeenth operation is to undercut the base recess preparatory to threading. This is done on a milling machine designed for this particular purpose and built by the Martin Pump & Machine Co. This machine is very similar to the one in which the threading operation is done, the chief difference being in the form of cutter used. The shell is carried in a sleeve on the head, and revolves once, slowly, while the undercutting is being done. The cutter has an independent drive and forms two undercuts, one at the bottom of the recess and one at the edge. The undercutting is done to facilitate the threading operation.

At the next operation, the threads in the base recess are milled in a Holden-Morgan Co. milling machine. The shell is held in the hollow spindle which makes one slow revolution, being operated by worm and wheel driven from the countershaft above. The milling cutter is held in a bracket and has an independent drive. When this operation has been completed the shell is taken out to another machine to have the bottom of recess faced up, making the nineteenth operation.

A machine somewhat similar to the one just described is used for this operation, but is of simpler design and has no milling attachment. The shell is held in a hollow spindle, but has no feeding arrangement as in the case of the milling machine. In place of the milling attachment is an ordinary facing tool in a tool post on the cross slide. The next operation is to drill the grub screw hole in a vertical drill press, the hole afterwards being hand-tapped on a bench adjoining the drill. The shell is now inspected, particular attention being paid to the base recess before the base plate is screwed in.

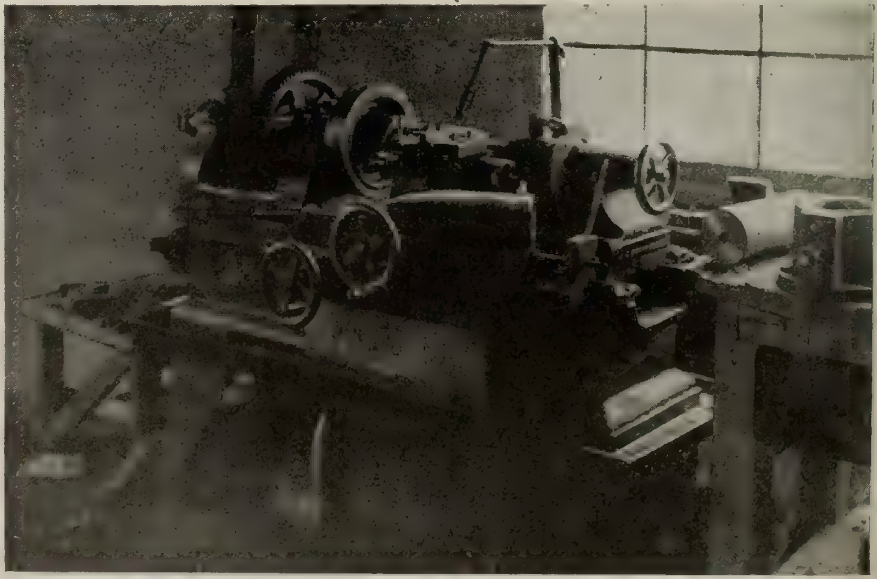
Before being screwed into the base recess, the base plates are painted with a special composition or cement. The machine , used for this operation is mounted on a table, the shell being securely held in a vise. By means of a train of gear wheels the operator can exert considerable twisting force which screws the base plate home and then twists off the square end of plate. This saves one operation, as in some shops the square end is cut off either on a saw or in a milling machine.

The twenty-second operation consists of riveting or peining the base plate. The machine used is a power hammer supplied by the High Speed Hammer Co., Rochester, N.Y. The shell is placed nose down over a vertical spindle on the table, swung under the hammer and turned slowly by the operator while the hammer is operating. The hammer strikes on the outside edge of the base plate, thus securing it firmly in the base recess.

The shell is next taken over to a machine to have the base faced up and finished. The machine used is a Martin facing lathe. Two cuts are taken, roughing and finishing. The series of operations on the base being now completed, the shell is again inspected, after which the necessary markings are stamped on the base and outside diameter. The waves are also nicked with a cold chisel and the nose tapped.

Copper Band Pressing On and Turning

The twenty-sixth operation is pressing on the copper band into the groove already prepared for it. The copper band is placed in the groove and the shell inserted in the hydraulic banding press. The press was built by William R. Perrin & Co., as was also the triplex pump supplying the necessary pressure. The shell is placed nose down on a bracket to which a weight is attached to assist the operator in placing the base of shell in the die which is in the top of the press. The pressure is applied



GROOVING, WAVING AND UNDERCUTTING EQUIPMENT FOR COPPER BAND GROOVE; "MARTIN" MECHANISM.

three or four times, the shell being turned to ensure equal distribution of pressure on the band.

The copper band is now finish-turned on a machine built by the Martin Pump & Machine Co. The shell is held at the base by a chuck fitted with a drawback tightening arrangement, while the nose is carried in a cup-holder on the tailstock, the cup-holder being supported by a carrier. On the cross slide are mounted a roughing tool located under the work, a forming tool at the front, and a finishing tool on a fixture at the back. The forming tool travels at right angles to and rough turns the copper band. The forming tool then does its work followed by the finishing tool at the back. The finishing tool is fed by a hand lever, and travels down and past the copper band, just shaving it.

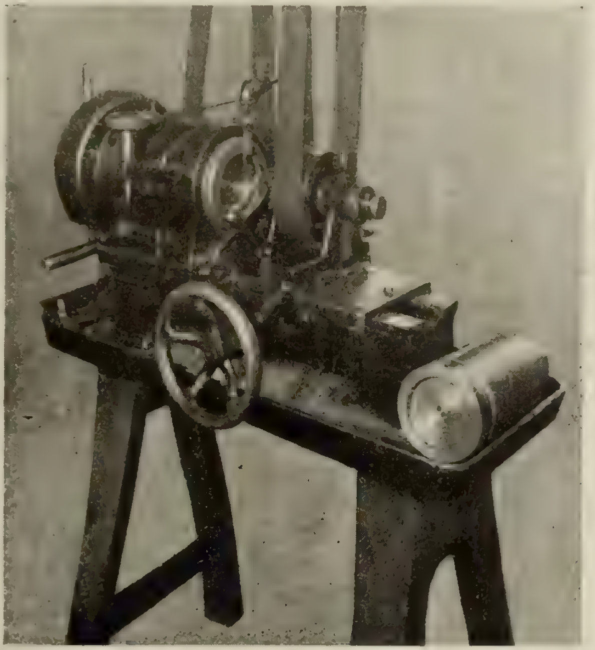
Base Plates

A subsidiary operation consisting of machining the base plates is done on a Martin milling machine designed for the purpose. The turning tools are arried in tool posts on the front of cross slide, while the milling cutter is carried in a fixture on the back of cross slide and has an independent drive. The first operation is to rough and finish the face of base plate. Both tools are in the same tool post, the roughing tool preceding the finishing tool, being set ahead of its. The outside diameter of base plate is turned in two cuts. The milling fixture is now brought into operation for forming the threads on the outside diameter of base plate. An arm attached to the fixture carries a chaser nut which is swung over and engages with the threads on the end of main spindle, this arrangement allowing for the required number of threads being cut on the base plate. The speed of the main spindle is reduced so as to make one revolution while the threads are being cut. The milling cutter is operated by an independent belt.

Varnishing and Painting

After the copper band has been turned the shell is washed to remove all grease, etc., then inspected and taken over to be varnished. For the varnishing process a heavy-body air-drying varnish is used, supplied by The Sherwin-Williams Co. No baking is necessary, but the shells are sometimes warmed before being treated to assist the drying, an electrically heated oven being used. After the varnish has been applied, the shells are placed in wooden racks, nose down, to drain and dry, the time varying according to climatic conditions.

The shells now undergo the final inspection and are then painted. A sample of varnish is also taken and tested. The painting is done on a table fitted up with an arrangement for holding the shell and rotating it. A vertical spindle, with a cup on the end, comes up through the table, the spindle being driven from the line shaft. The shell is placed nose down on the cup and while it revolves the paint is applied by means of a brush. Only one coat of paint is required and the color is yellow ochre. When dry, the plug is screwed into the nose and the shells packed, two in a box, for shipping.



"HOLDEN-MORGAN" SHELL BASE RECESS THREAD MILLING EQUIPMENT.

MUNITION WORKERS' WOES — GLASGOW GIRL'S EXPERIENCE

"MANY women are going in for munitions," I read—a fact that somehow reminded me of Queen Anne's decease—"especially shell-making, where they make big money, $100 a week."

That last clause was news to me, and probably to many others. After some abstruse calculations worked out with a wet towel round my head, strong coffee, and a big bill to the Electric Light Company, I found that $100 a week figured out at about five thousand a year. That was the job for me, I decided, and began to see visions and dream dreams of rolling up to my daily toil in a Studebaker or a Rolls-Royce.

"I forthwith made my application, and was told I must sign on for six months.

"Is that all!" I exclaimed, greatly disappointed; "I thought it was for the duration of the war and six months after."

Dreams of a Motor Car

Six months of munitions, even at $100 a week, would scarcely run to a Rolls-Royce, upholstered in grey suede, plated fittings, and a silver flower-holder. The flower scheme would be mauve or purple, to look well against the grey suede.

Then I was informed that at the expiration of that term—if the war held good—I could sign on for another six months, and so on, ad libitum infinitum. With that I was forced to be content.

The next step was my credentials . I had to get an obliging friend to rake up the records of the past to prove that I was a bona fide born British subject, without a taint of Germanism in my make-up. I next received a card for a huge emporium, where they turn out uniforms of all descriptions, from a humble boiler-suit to the full dress rig of an admiral or general. After having my measurements taken I was hustled into a khaki overall that fitted where it touched.

"This is much too large," I said; "it will require a great deal of alteration."

"Oh, no; that fits you beautifully," was the bland answer.. "You see, you have to allow for shrinkage in washing."

From that onwards I found myself caught in the meshes of the mystery of the age—the insurance problem; and my struggles at disentanglement were as futile as a lamb among the folds of a boa constrictor.

Learning the Trade

My first day in a machine-shop was memorable for one of the most excruciating headaches ever experienced. The roar and rattle of machinery was deafening, and I marvelled at the ease with which the girls talked and understood each other, without even raising their voices. Several spoke to me. I knew they spoke, for I saw their lips moving; but not being versed in lip language I had to make negative gestures in dumb show.

The general mode of teaching in large munition factories is to place the novice beside an experienced worker, where, by using her eyes and the verbal mark of interrogation to some purpose, she is supposed to lose her novitiate in a week Think of it, ye would-be munitionists! We are to acquire in a week a working knowledge of engineering—superficial though it may be—that takes a man five years' apprenticeship to master. As I looked at the seeming hopeless conglomeration of levers, cranks and spindles, I thought a lifetime seemed all to short to master the intricacies of a machine, but as the days passed a sort of cosmos gradually evolved out of the chaos. Each crank and lever had its allotted work to do, and when one began to understand the reasons for the various parts of this steel medley the intricacies vanished and one's interest was aroused.

Tragedy and Comedy

At the end of a week I was put on to a machine of my own, and then my troubles began. I soon proved the well-worn fact that it is one thing watching another work a machine, but quite a different matter when you come to do the job yourself. I was at the process called "fine-boring." The first—and what seemed the simplest part of that process—is hammering the shell into the chuck. As an offstart, I didn't hammer it in tight enough, consequently jammed my shell and had to get the mechanic to bang it out. My next attempt was not much better, for I hammered a finger as well as the shell, and was assisted to the ambulance room.

Another little matter that seemed simplicity personified under the hand of the experienced worker, was the manipulation of the water tap. On these machines an adjustable pipe is fixed, for a flow of water must constantly play on the shell, otherwise the cutters would get red hot. For the first few days I drenched myself and everyone else within hailing distance. That stream of water squirted in every direction but on the shell, and became more obstreperous the more I wanted it to behave.

A great naval personage, resplendent in brass buttons, epaulets, and a monocle, was being shown over the works by the manager. As ill-luck would have it, he stopped beside my machine. I got nervous; the stream of water got cranky; and the great naval personage got it full in the eye! Some others of my woes are, however, too tragic, and we will mercifully veil the grim tale of ruined shells, smashed cutters, and wrecked machines.

No doubt the mechanics could tell some amusing yarns of the woman munition worker. After some weeks experience, I was one day congratulating myself on being at last perfectly proficient. The machine was working beautifully, and the shells were turning out A1. Unfortunately it was too good to last. Something seemed to go wrong. I was "bottoming" a shell, and pressed and hauled the handwheel till the perspiration came trickling off me, and splashed on the machine; yet I didn't make the least impression.

In a frantic flurry, I ran for a mechanic. When he came up, a slow grin overspread his face as he drawled sarcastically, "Do you not think it would be a good plan if you started your machine?"

I had forgotten to pull the starting lever, and my machine was not working

$1.75 to $12.25

"My first pay was $1.75. A dollar and seventy-five cents for the hardest week I ever wrought! As I stumbled home, a weary, wan, and wild-eyed wreck, I thought of my beautiful dream-car, and laughed a bitter cynical laugh; but then, I reflected, I am only at the learning stage, and practice is all that is required for proficiency. Gradually I improved, and soon learned the art of picking my shells. If by chance I lifted a bad one I quietly put it back, and let someone else risk a broken cutter; for a bad or hard shell is ruinous to the cutter, and requires an experienced hand to bore and polish successfully.

I have now almost completed my six months' hard labor. The most I have ever earned is $12.25 for a week's work. With another six months' practice I might manage $13.35, or, by a stroke of good luck, $14.60, but I know it is outside the bounds of possibility to squeeze out a cent more. Therefore, I have only one thing to live for, and that is revenge.

First, however, I must find that descendant of Ananias who gave forth to the world the imagined creations of a fevered brain, under the guise of truth, and when I find him—

I have not yet decided on the particular mode of torture I will use to make him eat his words.

* * *

BOARD OF TRADE IRON AND STEEL INDUSTRIES COMMITTEE

THE British Board of Trade has appointed a committee to consider the position after the war of the iron and steel industries. The committee is composed of the following gentlemen: Mr. G. Scoby Smith (chairman), Sir Hugh Bell, Bart.; Mr. Archibald Colville, Mr. John Hodge, M.P.; Mr. James Gavin, Mr. George Mure Ritchie, Mr. Henry Summers, Mr. Benjamin Talbot, Mr. John King, and Mr. John E. Davison.

In order to carry out its investigations the committee desires to elicit exact and detailed information from a number of representative and individual firms, and from industrial, commercial, and labor organizations, with respect to:—

(1) The extent and area of trade, and capital normally employed.

(2) The dependency upon resources external to this country for supplies of material and plant.

(3) Labor relations, labor restrictions (if any), and comparative conditions in the industry.

(4) British methods of conducting foreign business contrasted with foreign methods of conducting export business.

(5) The effects of manufacturing and commercial co-operation upon trade at home and abroad.

(6) The extent to which British industry is adversely affected whether as regards (a) the retention of business hitherto or previously secured, or (b) its capacity for expansion, by the existence of foreign tariffs, preferential arrangements, bounties, subsidies, or special facilities granted by foreign governments, railways, or trade combinations, to their manufacturers or exporters; and what is the remedy.

(7) Terms of payment and of credit.

(8) Technical education, skill, and nature of employees.

(9) The effect, if any, of wayleaves, and mining or other royalties upon the industry, either as regards home or export trade.

(10) The effect, if any, of railway and shipping rates upon the industry, as regards home or export trade.

(11) General information.

The recommendations of the committee must depend for their effectiveness upon the co-operation of all who are interested in the British iron and steel industries. The committee, therefore, invites the active support and assistance not only of individuals, but also of industrial organizations of whatever character. The committee suggests that the various trade organizations should submit either through their secretaries or through small committees, a general statement of their views together with suggestions which in their opinions might suitably be supported by the presence of a deputation representative of the organization as a whole. The committee will be glad to receive statements supported by verbal evidence from representative firms and from individuals whose depositions, in the opinion of the committee, will be valuable to their work. It will also welcome the assistance of import and export merchants who are interested in the handling of the products of the iron and steel industries at home and abroad.

* * *

TRADING AFTER THE WAR has been discussed by the Johannesburg Chamber of Commerce, and the result is a comprehensive series of suggestions in support of Imperial tariff preferences, the establishment of Government assistance of key industries, differential charges against all enemy shipping at South African ports, the refusal of trading licenses to enemy subjects or to agents of enemy firms, the exclusion of enemy trading journals, advertisements, and price lists, and reciprocal tariff relations with other countries, without, however placing them on an equality in the British Empire.

PRODUCTION METHODS AND DEVICES

A Department for the Interchange and Distribution of Shop and Office Data and Ideas Evolved from Actual Practical Application and Experience

MACHINING A BLIND HOLE HAVING THREAD LIMITATIONS

By F. Scriber.

It sometimes happens that work which is in itself comparatively easy to machine may be lifted out of the ordinary class by having some special condition attached to its manufacturue. Such a condition is evident in the part illustrated by Fig. 1 where the operations to be performed are plain turning, boring, tapping, milling and drilling operations, but as the hole through the work is closed at one end and the thread must start in correct relation to the drilled bosses the fixtures used for machining this piece are quite interesting.

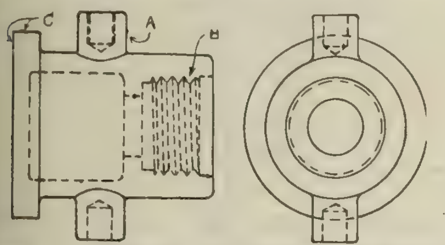


FIG. 1. SKETCH OF PIECE SHOWING BOSSES FROM WHICH THREAD MUST POSITIONED.

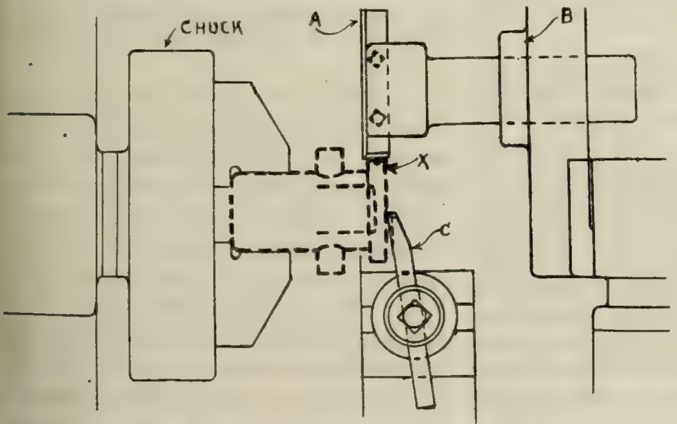

FIG. 2. TURNING AND FACING CLOSED END OF PIECE.

Bosses Control Threading

Referring to Fig. 1, which shows the work which is to be machined, it will be noticed that there are two bosses A. In assembling these pieces with their units the position of the thread B in relation to these bosses is an important consideration, and this must be borne in mind throughout the complete tooling arrangement. The work on this piece is carried out in four operations, namely, turning and facing the closed end C, milling the bosses, boring, tapping and facing the open end, and drilling the holes in the two bosses.

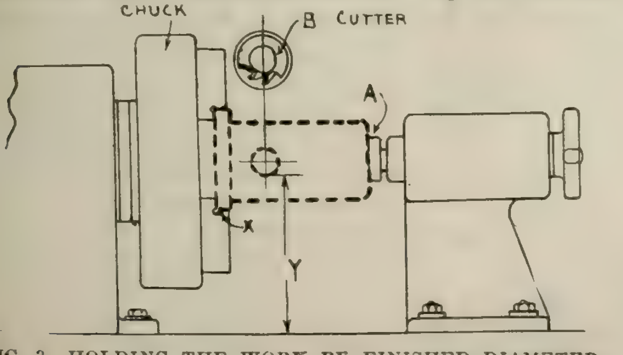

FIG. 3. HOLDING THE WORK BY FINISHED DIAMETER WHILE MILLING BOSSES.

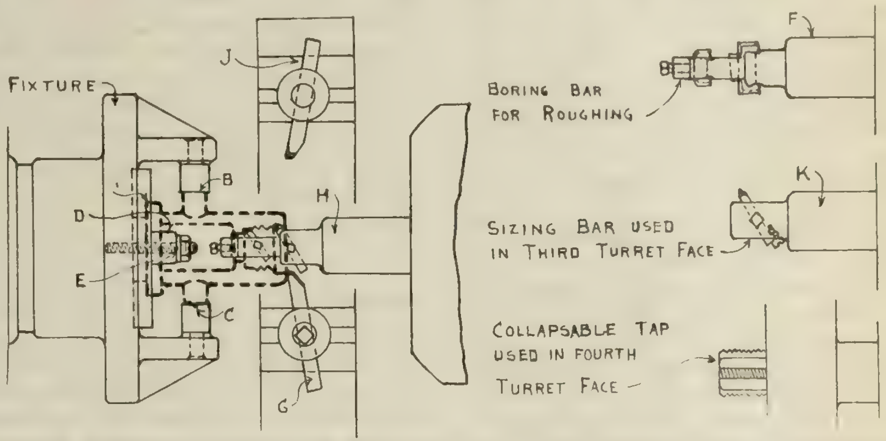

FIXTURE
J

BORING BAR FOR ROUGHING
K
SIZING BAR USED IN THIRD TURRET FACE
COLLAPSABLE TAP USED IN FOURTH TURRET FACE

FIG. 4. METHOD OF HOLDING WORK WHILE MACHINING AND THREADING OPEN END. AT THE RIGHT ARE SHOWN THE VARIOUS TOOLS USED.

The first operation — turning and facing the closed end—is completed as shown by Fig. 2. At this operation the work is gripped on the rough diameter in a three-jawed chuck, and the diameter X is turned with tool A, which is held by suitable holder B to the turret of the machine, while the end is faced by the tool C held in a cross-slide. This is completed by taking the usual roughing and finishing chips, using the tools held on front of cross-slide and on one turret face for roughing, while the tools held on the rear of cross-slide and second turret face are used for finishing.

The next operation, which must precede the boring, etc., is milling the bosses, and in this respect care must be exercised to have the bosses directly opposite each other when milling them. Referring to Fig. 3, the work is held by the finished diameter X in a soft jaw chuck and a test rod is used to determine when both bosses are an equal distance from the table, as indicated by the dimension line Y. When the bosses are located in a horizontal position by this method the pad A held in the tailstock of the milling machine is brought up to support the end of the work, and one boss is faced off by the use of a milling cutter B.

Following this, the work is indexed half a revolution and the other boss is milled. The tools for this operation, as is obvious, were all standard, such as the index head and tailstock centre for the milling machine, and likewise tools for the first operation were standard, as furnished with the machine.

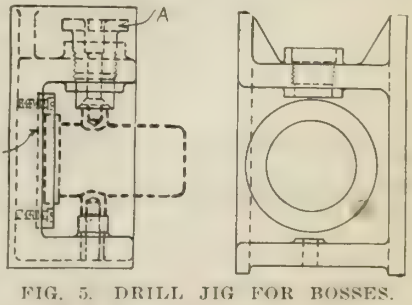

FIG. 5. DRILL JIG FOR BOSSES.

Fixtures and Tools for Threading

The tools for the third operation, Fig. 4, are the most interesting, as at this time the thread is cut. Referring to the above illustration, the work is held by a special spindle nose fixture locating at A from the end and finished diameter, and at B and C from the bosses for radial location. The work is securely held in position by clamps D, one at each side these being tightened by screws E. To machine this end, four turret faces and the front and rear blocks on the cross-slide are used to hold the tools, the cuts to be made being rough bore hole, using bar F and two flat cutters, rough face end with tool G in front cross-slide, finish bore holes, including hole to be threaded, using bar H and three single point cutters finish face end with tool J on rear cross-slide block. In the hole of the third turret face a short bar K, containing one cutter, is held for size boring the end of hole, while in the hole of the fourth turret face the tap, which is of the collapsible type, is held. This tap is located in the turret hole so as to start the thread in correct relation to the bosses.

For drilling the bosses, reference is made to Fig. 5, which shows a simple jig that locates the work from the bosses by means of a screw bushing A, while the closed end of the work is held in the ring B. This jig is constructed so it may be turned over, so the bosses may be drilled without disturbing the work, thus making certain that the holes are drilled opposite.

◆

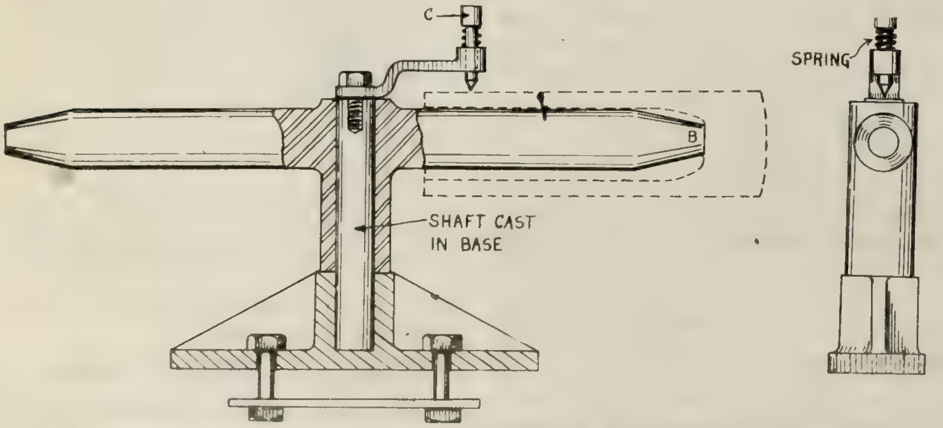
HANDLING RIG FOR SHELL CUTTING OFF MACHINE.

by John L. Watts

THE operation of cutting off the open end of the 4.5 in. shell in a cutting off machine has been expedited by the use of the rig shown herewith.

The placing of the forging in the chuck of the cutting off machine and the removing of the forging after cutting off is very tiresome on account of the weight of the forging. Also one's fingers are apt to be jammed if care is not exercised. This rig was designed to overcome this difficulty and does it successfully.

The equipment is intended to be bolted on the bed of the cutting off machine with end of the carrying arm as close to the chuck as it can conveniently be placed and be able to swing around with a shell forging on it.



DEVICE FOR MARKING AND HANDLING SHELLS IN CUTTING-OFF MACHINE.

Now assuming we have a shell in the machine and the cut started, we place another shell on the arm B and strike the center punch C, which is so placed as to mark the shell at the point at which it is desired to cut it off, care being taken to ensure that the shell is against the end of the arm. When the machine has cut off the shell in the clutch, this finished shell can be easily slid onto the empty arm, the whole thing is then revolved a half turn which brings the other shell on arm B into a position from which it can be slid along the arm into the chuck. While this 2nd shell is being cut off the 1st shell is removed and replaced with a 3rd one which can be marked ready to put in when the 2nd shell is cut off.

◆

MAKING THE SHOP-LADDER SAFE

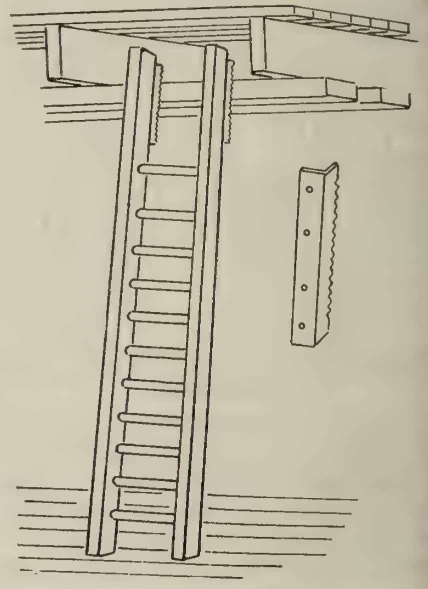
by A. D. I.

AMONG the many kinds of industrial accidents that occur in factories, none are perhaps so common and have such serious and fatal consequences, as those due to slipping shop-ladders. While a great deal of study has been given to render these safe, most of this attention has been given in providing means in having the feet of the ladder properly equipped with rubber or steel-pointed shoes.

Watch the Top

It never occurs to anyone that the top of the ladder, where so many exertions take place by workmen in doing overhead work, requires suitable equipment of some kind to prevent ladder from swaying from side to side. For as everyone knows who has had occasion to use one, a ladder, whenever placed against a stringer will seldom remain in position while one is standing on it, and workmen, are obliged to take hold of a stringer with one hand in order to hold the ladder steady, by which they are greatly handicapped in handling tools, etc.

In the accompanying illustration, is shown an easily made simple attachment, that can be fastened to the top of any shop-ladder, which will prevent them from swaying sideways, and also from slipping outward at the feet as usually happens. Referring to the sketch, two short strips of 1¼ in. angle-iron, having several teeth notched in on one side, are screwed in at the back of the ladder at the top as shown. When the ladder is placed against a stringer, the teeth become imbedded in the wood, causing the ladder to hold firm when so placed. There is little possibility for the ladder moving, and workmen can freely use both hands when working overhead.



SAFETY DEVICE FOR TOP END OF SHOP LADDERS.

Shop ladders are nearly always standing upright against walls and beams, owing to the less room they take up. As is well known these are often jarred against belts and pulleys and have to be constantly watched. In the adoption of this attachment this will hereafter be unnecessary, and also ladder accidents will be greatly checked, and less frequent than they are now.

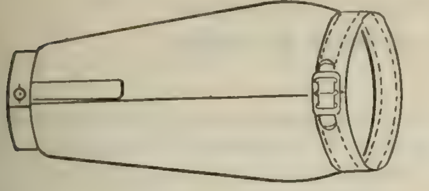
◆

A SLEEVE HOLDER KINK

by J. Wright

DRAFTSMEN and others who are in the habit of wearing sleeves in their work, have always experienced trouble in keeping these held up on the arms, for as soon as the elastic contained inside the band around the top of the sleeve becomes stretched a little, the sleeve becomes loose and is constantly slipping down.

In the enclosed sketch, is shown a useful kink, wherein this trouble is overcome. A pair of adjustable sleeve-holders or armlet-elastics are placed inside the sleeve band, having the buckles protruding out as shown. When the sleeve becomes loose, it is only necessary to take up on the elastic by pulling the ends through the buckles.



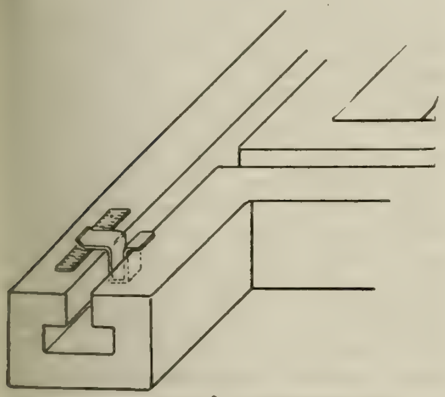
USEFUL IDEA FOR HOLDING SLEEVES.

A SCALE-CLIP

by E. V. A.

WHEN it is necessary to have in constant use a scale for measuring turned work on a lathe, it is the practice of lathe hands and machinists to lay the scale on the machine carriage in order to have it handy when needed. Very often the scale falls in the tee-slot or drops off into the drip-pan under the machine, and considerable time is wasted in searching for it.

In the accompanying sketch is shown a handy scale-clip that can be fastened in the opening in the tee-slot in the lathe-carriage. It is made from a piece of flat sheet steel, bent and tempered in the shape as shown. As seen, the scale is slipped under the clip, each time it is laid down, and always remains in position where it can be picked up quickly.



SCALE-CLIP FOR LATHE HANDS.

ESTIMATING METAL TEMPERATURES BY COLORS

THOUGH the use of pyrometers in foundry work has greatly increased of late years, there are certain conditions under which they cannot be applied and it is then necessary for the foundryman to be guided by the eye. The following tables, given in the Foundry Trade Journal will be found useful as a general guide to the relation between temperature and appearance.

	Deg. C.	Deg. F.
First visible red	525	977
Dull red heat	700	1,292
Turning to cherry	800	1,472
Actual cherry red	900	1,652
Bright cherry red	1,000	1,832
Dull orange	1,100	2,021
Bright orange	1,200	2,192
Bright orange	1,200	2,192
White heat	1,300	2,372
Bright white heat	1,400	2,552
Dazzling white heat	1,500	2,732

Tempering and Hardening Tools

	Deg. C.
Light straw	220 to 230
Dark straw	240
Yellowish brown	255
Reddish brown	265
Purple	275
Violet	285
Cornflower blue	295
Pale blue	310 to 315
Sea-green or grey	330

TOOL TREATMENT IN RAILWAY SHOPS

EXPERIENCE in the locomotive workshops of the Illinois Central Railway has shown that the best results with taps, dies and other tools made from 1.10 per cent. carbon steel are obtained by heating them between 1,350 and 1,600 deg., according to their size. The 0.9 per cent. carbon steel which is used for mandrels, beading tools, etc., is heated between 1,400 and 1,625 deg., and the foreman blacksmith, who has charge of the work states that in hardening the tools he finds it more satisfactory to dip them on a declining temperature; that is to say they are heated slightly above the required temperature and then allowed to cool down again before dipping.

In dipping spiral reamers, they are rotated slowly in a direction opposite to that of the spiral, and this, it is claimed, prevents warping. The long taps and reamers are packed in charcoal in an iran tube brought up to a red heat in an oil furnace and soaked at the proper temperature in the electric furnace. It takes from 1 to 1½ hours to bring the furnaces up to working temperature, which might be considered a disadvantage were it not for the fact that the gradually risng heat can be utilizing in drawing the temper on some of the tools hardened the previous day.

The temperatures at which the furnace is used ranged between 1,350 and 1,625 deg. Fah., according to the size of the tool being treated and the grade of the steel. In handling this grade of steel it is necessary not to permit soaking heats; that is, as soon as the steel has been brought up to the required temperature it should be removed from the furnace. A certain amount of air is allowed to enter the furnace while treating the steel, as it has been found that a reducing atmosphere will produce soft spots on the tool.

ANTI-SLIP LADDER FOR TILE OR WOOD FLOOR

By J. E. Noble.

MAKE two hooks, as shown at A and B, Fig. 1, and fasten them to the ladder ends tightly with screw nails. When using the ladder on a rough wooden floor pull down the hooks and tap the point into the wood with the heel of your boot, and the ladder will be then absolutely safe.

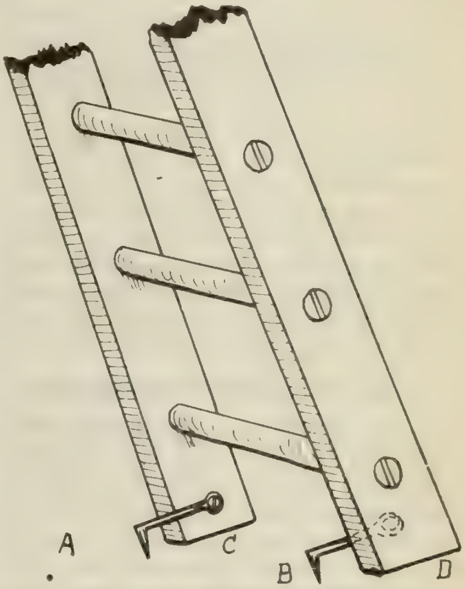


FIG. 1. ANTI-SLIP LADDER.

For using a ladder on tile, polished wood, or any other smooth floor, nail a piece of sheet rubber (a piece of old auto tire or rubber fire hose will answer) on the bottom of the ladder legs at C and D, shown at E, Fig. 2. The two ideas can be used in combination on one ladder, if desired.

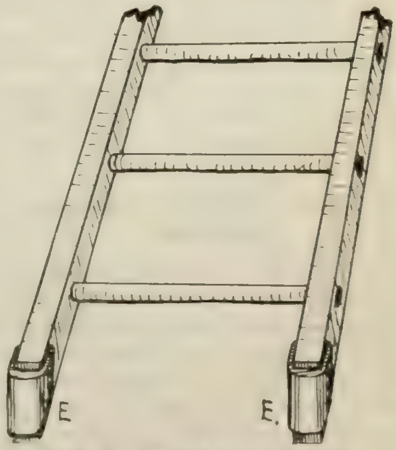

FIG. 2. ANTI-SLIP LADDER.

MACHINES AND THE NEW MECHANIC

By R. I. N.

"WHAT is to be the status of the machine industry when peace is restored, and normal conditions again prevail?" It may probably be premature to dwell upon, but some considerations might not be out of place, regarding a few of the possibilities that may confront us at the expiration of present hostilities, in view of the fact that the unprecedented activities of the past two years have effected many changes, the extent of which will not be fully realized until the present crisis has been passed and our minds and bodies are permitted to resume their normal state of mental and physical action.

Factors of the Coming Adjusutment

The necessity of concentrated effort towards a common goal has so occupied the attention of every conscientious person that the train of thought has been kept on the main line, often allowing the side tracks to be overlooked, if not entirely forgotten. The favorable progress of events however, might well be considered as a good reason to review the equipment that will eventually be utilized for pre-war pursuits.

Two of the outstanding factors in the problem of post-war adaptation, will be the volume of machinery on the market and the new "mechanics" which abnormal conditions have produced. While both, at present, are apparently unknown quantities, their respective values can be more readily calculated in relation to the duration of war activities.

Machines Depreciate, Operators Appreciate

It is quite obvious, owing to the special nature of the various operations of munitions manufacture and their confinement to certain tools, which are constantly being forced to their maximum capacity—that the value of the machines will depreciate much more rapidly than under ordinary conditions. On the other hand, the training that the army of shell workers are receiving at the present time, will fit large numbers for positions in the ranks of the "skilled" mechanics, when the country settles down to more peaceful pursuits. What effect these conditions will subsequently have on the iron trade industry is as yet, a matter of conjecture; but with such an overflow of men, who for the past two years have been doing work that has called for keen judgment, accurate and sensitive manipulation of precision tools, it is safe to assume that the machine trade especially, will have to face a situation without precedent. The possibility of certain radical developments in methods of manufacture, may to some extent offset the changing conditions, but the future alone can reveal the ultimate solution.

Loss of Skilled Help

During the incipient period of munitions making in this country manufacturers were called upon to utilize, to a great extent, their existing equipment, and the additional machinery then available was generally of standard design, the successful operation of which required a reasonable amount of skilled labor. Experienced mechanics at that time were becoming scarce, owing to the heavy enlistments for oversea's service, which included men for British munition plants in addition to those for army purposes. The result of this drain upon the trained workmen, was the immediate necessity of initiating the so called unskilled element into the "secrets" of the trade, in order that no obstacles should arise to prevent a continuous output of shells.

As the ever increasing need of unrestricted production was impressed upon the industrial interests here in Canada, firms already working on shells enlarged their plants and added to their equipment. Other establishments brought themselves into line, until the greater number of the leading engineering concerns—and many of the lesser firms—had entered into the work with such enthusiasm, that the ultimate results not only surprised those directly concerned, but proved of such a remarkable character, as to receive the praise and commendation of those in the old land, who had been making munitions for many years.

Development of Mechanical Thought

The advent of this industry, on such an enormous scale, appeared to be the signal for the release of the latent energies of numerous mechanical men who were rapidly transformed into an active force, the power of which has been reflected in the large number of special machines, attachments, devices etc., that have been designed and constructed for increasing the output, and decreasing the cost of production.

While the developments that have taken place in special machinery, for rapid and economical shell production, have been very remarkable, it is probably the changing status of the human factor that will eventually be a contender for first position, in the notable changes brought about as a result of the war and its various activities. It might be said, without exaggeration, that nearly fifty per cent. of those men now working on the manufacture of shells, had little or no knowledge of the operation of metal working machinery, before their entry to a munitions plant. Bakers who had been "loafers" all their lives, were required to work to the closest specifications; hair splitting barbers had to cut to gauge sizes instead of simply appearance; carpenters, accustomed to working to about one-eighth of an inch or more, were compelled to confine their measurements to much finer limits; in fact men who, in many respects were pratically ignorant of even fairly accurate dimensions, were quickly initiated to the stage where thousandths of an inch, over or under a specified standard, might mean the scrapping of a shell. Many of the best workmen in shell plants to-day, are men who have had no previous experience in machine shop work, but have readily adapted themselves to existing conditions, with such characteristic ability, that their present capacity as mechanical prodigies is truly remarkable.

Personal Aspects of Future Help

It might be said that the average man's energies, under present conditions are being confined to one, or probably two particular operations, and his future value as a mechanic would be insufficient for him to command attention under normal conditions. This may be true respecting many of the more intricate branches of the machine tool industry, such as variety job work, tool construction, jig making, die work, etc., where considerable fundamental knowledge is absolutely essential; but in the case of volume production, where quantity is the issue, these men, who have received a thorough training in the manipulation of special tools and close limit gauges, will be in a position to enter any of these manufacturng establishments with the utmost confidence.

Will Breaking In Be Necessary

It might be well therefore, for manufacturers and others to consider this phase of what promises to be a unique situation, as it is a well known fact that large sums of money are spent yearly in breaking in new men to certain lines of industry. While many of these erstwhile shell makers may be experienced enough to profitably fill a position as a machine operator on repetition work, it would be highly undesirable to engage offhand an "experienced mechanic" for various classes of machine tool work, where a fair knowledge of elementary principles is absolutely indispensable.

CRITICISING OLD EMPLOYEES

by J. E. C.

IT is a well-known fact, that workmen who have grown old in the service of a company where they are still employed, often come in for a great deal of criticism. Every mechanic or writer who has any suggestion to make for rapid-production methods, greater efficiency etc., seldom fails to put along side his suggestion, some hint of discharging all old workmen, and, if they had their way, they would relegate them to some sort of "industrial boneyard'.' Some things have been said and written about old employees that has been unfair and greatly exaggerated.

Some of the faults attributed to them, may to a certain extent be true, but no one who has had experience in dealing with shop-help, would be willing to accept a statement that the older workmen have a monopoly on all the faults often ascribed to them.

Retention Due to Value

A little investigation concerning aged employees in machine-shops will disclose many interesting and truthful facts, not generally or willingly conceded to them. While a few no doubt are past their "years of usefulness," so-called, a great many of them are still retained for reasons other than charity or sentiment, as a great many are inclined to think.

A few cases are here cited of old employees, who are still "making good" in a long established concern of machine manufacturers where they are still employed. The first of these to be mentioned, is a workman now 79 years of age, whose term of service in this particular factory is nearing the half century mark. His work consists in testing machines. He is an excellent workman, and a mechanic of the first order. Besides his regular work, he can easily turn his hand to pattern-making and similar jobs. He is also something of a genius, as nearly all the improvements made in this factory in the past thirty years have come from him, and he is still capable of developing ideas.

A Versatile Octogenarian

Another employee, 80 years old, is still an expert in filing and fitting. His work includes that of fitting heavy cross-slides, cutting spiral grooves in crank shaft boxes, fitting and driving fly-wheels keys and other work connected with engine-beds. He is handy in laying-out and cutting sheet-metal work, he can also do general blacksmithing, hardening and tempering tools etc.

The next aged employee is one who has reached his three score years and ten, and has a long record behind him of faithful service in this factory. He is an all-round drill-press hand, and can do a variety of drill work either with or without jigs, and knows all the "kinks" and "knacks" in this line, that the average machinists do not possess. He can easily scale a ladder, lace up and put on belts, take down and put up shafting and do any overhead work. He can splice a rope and tie any kind of knot. In work of jacking up and taking off heavy castings from planer beds etc., he renders timely and profitable aid, because he knows "the how" in doing work of this description such as blocking up, etc. He long ago learned the rudiments of "safety first," and has been several times the means of preventing many younger workmen from injuring themselves.

Always on the Job.

It is seen from this short list of aged employees, that the reasons for still keeping them in employment, are entirely commercial, for each of them produces in his labor more than an equivalent in wages received. One other reason might also be attributed to their retention, and that is, that whenever and wherever any of their respective services are required, they are always "on the job" to undertake them. Faithful in the smallest tasks, and doing each of these to the best of their ability. And it can not be said of them, that they are always eyeing the boss, or watching the clock on the wall.

Younger workmen should learn to forbear with those few, whose weight of years sometimes make them appear peevish and cross. Older workmen, it is well-known, have shown a similar tolerance towards many of the younger help, namely in their immatured judgments and inexperience. Old age should be respected in machine shops, as well as elsewhere.

MACHINISTS' INSTRUCTION COURSE—IX.

By J. Davies.

WHEN the tapered portion of a shaft is short and abrupt, it can be turned most conveniently by means of the compound rest, the setting of which can be done in a number of ways, in addition to the one just described. The base of the compound rest is usually of circular form and graduated with degrees, so that it can readily be set to any desired angle.

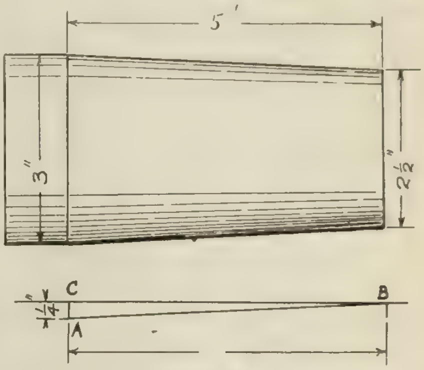

FIG. 32.

Taper Turning With Compound Rest

If the angle of the job is given, it is a simple matter to set over the compound rest half the amount of the total taper. When the angle in degrees of a taper is not known it may be found by laying off the dimensions on a piece of drawing paper or tin. Make a horizontal line AB, Fig. 32, equal to length of taper, then a vertical line, AC, equal to half the difference of the diameter. Complete the triangle and measure with a protractor, or transfer the angle with a bevel, placing the stock of the bevel against the face plate or side of the carriage if it is machined, and the blade against the cross slide, as shown in Fig. 33. This is a convenient method for boring taper holes. If the drawing is correctly executed, you can transfer the angle direct from the drawing with sufficient accuracy to take a roughing cut.

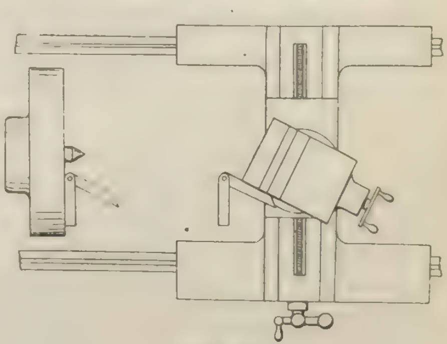

FIG. 33.

Another method is to get a piece of galvanized iron or tin and make a circle equal in diameter to the base of the compound rest, then make a horizontal line equal in length to the taper required, measuring from the centre of the circle.

At the end of the horizontal line measure off the amount of the taper and complete the triangle, Fig. 34. To apply this, measure the width of the angle from the centre line with dividers, where the angle cuts the base circle, put one point of the dividers on the stationary zero mark of the rest and swing the rest around until the movable zero mark coincides with the other point of the dividers. Don't throw this template away because the diameter of the base is always the same for the one lathe and a large number of tapers can be marked off on the same template and kept for reference.

Using the Taper Attachment

Many modern lathes are fitted with a taper attachment, which is a device for moving the tool in or out as it travels along the work. The graduations on this type of attachment usually indicate a taper of ⅛ in. per ft., so that to set the attachment for a taper of ⅝ in. per ft., it would set the attachment over 5 marks.

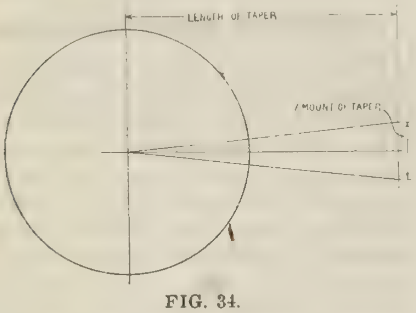

FIG. 34.

It has several advantages over the other methods of turning a taper; for instance, when the taper is once set it will turn the same taper on any piece regardless of the length, while the lathe centres are always in line and make a better job. When changing from straight work to taper, it is advisable to start the cut an inch or so beyond the end of the work and move the carriage up by hand to take out any lost motion there may be in the slide.

Height of Tools

No matter what method is used in turning taper, it is important to set the tool exactly level with the centre, and this can be done quite readily by using the mark on the tailstock. If the tool is set on the centre of the work and a cut taken off, and then the tool taken out and not put back at the same height, the taper of the work will be altered. If we should put the tool a little high it will take more off the large end, as will be seen by reference to diagram, Fig. 35, in which AB represents the path of the tool when correctly set at the centre, the small circle being the diameter of the small end of taper, and the large end the diameter of the large end of taper. Supposing the tool is raised above the centres to the line CD, it is seen that owing to the flatter surface of the large end, it is much nearer to the tool than the small end, looking along the line CD, which is now the path of the tool, so that it would alter the taper by taking more of the large end.

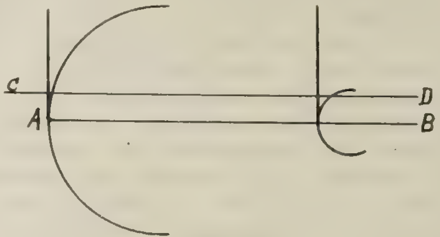

FIG. 35.

This fact can sometimes be used to advantage—the job in hand might be the least bit big at the large end, so, instead of moving the taper attachment raise the tool a little to take a little more off the big end.

Fitting a Tapered Piece

After roughing out a tapered piece it should be tried in the place it is intended to fit, taking care to leave it sufficiently above size to allow for fitting the taper. If one end is much too small it can be detected by rocking the work in the hole. After fitting till there is no perceptible play in the hole make a series of marks along the length of the taper with chalk or Prussian blue, place the work in the hole and give it a turn round by hand. The marks will be rubbed off the high spots and the taper attachment should be adjusted until the marks show a full bearing along the surface of the taper.

After fitting the taper satisfactorily, measure carefully how much further the taper needs to go into the hole to be in its right place. Suppose Fig. 36 is fitted correctly into the hole, but it requires to go ½ in. further in to be in its right place; measure with the calipers very carefully the diameter of the taper at the small end of the shaft, then take off a little cut and test with the calipers until the work is the same size as the calipers ½ in. from the end. By this means, after getting the taper a good fit, you can get it the correct siz at the next trial. It is better to err a little on the full size, as you can ther give it a rub or two with a file, but i too small there is no remedy.

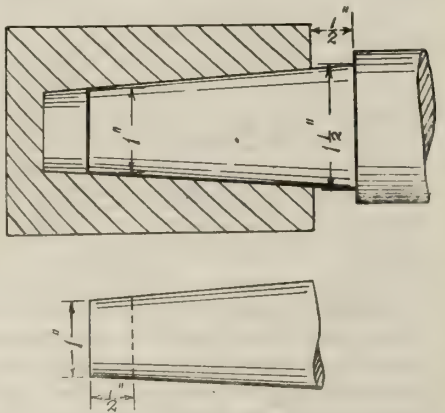

FIG. 36.

Filing and Polishing

Don't leave any more stock for filin on lathe work generally than is neces sary to remove the tool marks; in fact if you can get a good smooth finishin cut it is best not to file it at all.

The best files for lathe work are mil files. These are single cut files that ar not so liable to collect the filings int little balls called catspaws, that chok up the teeth, as is the case with doubl cut files. Look out for these catspaw or they will scratch the work at ever stroke of the file. Clean the file wel with a file card; rubbing on chalk als helps to keep it clean.

To keep the work round and true, fil with a long steady stroke, aiming to a low the work to make a number of rev lutions for each stroke of the file. If tl work should need polishing, very usef polishing sticks can easily be made a shown in Fig. 37. It is simply tw pieces of wood with a hole cut out th size of the shaft, and fastened together the back with a leather hinge. Polis either with emery cloth, or emery pow der and oil, run the lathe at top spee and ease back the centres while polis ing, because the heat generated in po ishing may cause the job to expand ar run out of true or twist the end of tl centre.

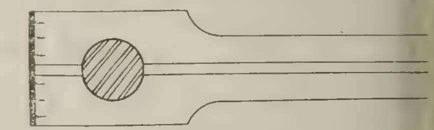

FIG. 37.

Using the Steady Head

Sometimes if the job is a very lo one, it will have to be supported with steady head to prevent it chattering ar springing away from the tool, but b fore using the steady head you mu have a true spot to put it on. Turn place near the centre if possible by u ing a narrow tool and fine feed, setti the tool well above the centre. If y cannot turn a true spot in the desir position on account of the shaft bei so slender, turn one as near to it possible, put on the steady head a turn another spot until you get t steady head in the right place.

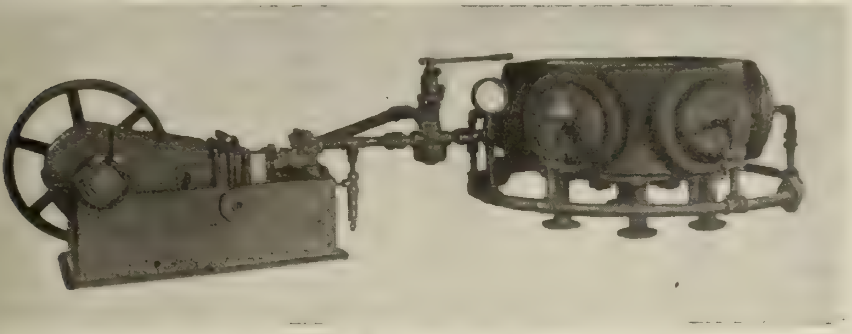
Make sure that the spot turned f the steady head runs perfectly true the work will not be true when finish To adjust the jaws of the steady he without springing the work close ea jaw on the work until they will j grip a strip of paper or a thin feel then close each jaw the least bit m and adjust for a running fit.

PROGRESS IN NEW EQUIPMENT

A Record of New and Improved Machinery and Accessories for the Machine, Pattern, Boiler and Blacksmith Shops, Planing Mill, Foundry and Power Plant

HYDRAULIC BANDING EQUIPMENT WITH HORIZONTAL TRIPLEX PUMP

A COMPLETE unit for shell banding work, consisting of press, pump and operating value, is shown in the accompanying illustration. The press, which is capable of exerting a total pressure of 950 tons when working at a maximum of 3,500 lbs. per sq. in., is suitable for banding shells from 6 in. to 12 in. size. It is constructed with 6 semi-steel rams, having a diameter of 11 in. and bearings 9 in. long. The rams are fitted with chrome leather U packing, and have a movement of ½ in. each, or more if necessary. The return of the rams is effected by means of heavy steel springs acting on levers which provide adjustment for tension.



BANDING PRESS FOR 12-IN. SHELLS WITH HORIZONTAL TRIPLEX HYDRAULIC PUMP.

All parts of the press subject to severe stresses, including cylinders are alloy steel castings on forgings. The dies are of forged chrome nickel steel, hardened, and can be removed by loosening two nuts without disturbing any part of the press.

The cylinders are removable and have a hydraulic inlet of 1¼ in. pipe, the distributing ring being 2 n. pipe. The weight of this press is 9,500 lbs. and it can also be operated from an accumulator if desired .

The pump illustrated is of the triple type, having three plungers of 3 in. stroke, and of diameter to suit the pressure, made of hardened and ground tool steel for use with oil, or of Tobin bronze for use with water. Removable poppet valves permit easy inspection of discharge or suction.

Alloy steel is employed for the cam shaft, which is carried in split phosphor bronze bearings mounted in a semi-steel enclosed self-oiling base. Connecting rods are of forged steel, with babbited cam bearings 5½ in. dia. x 2in. wide, while the solid crosshead is fitted with adjustable phosphor bronze bearings. Pump bodies are of hydraulic bronze tested to 50 per cent. over load.

The pump is fitted with driving pulley 30 in. dia. x 6 in. face running at 180 revs. per min. and weighs 3,300 lbs.

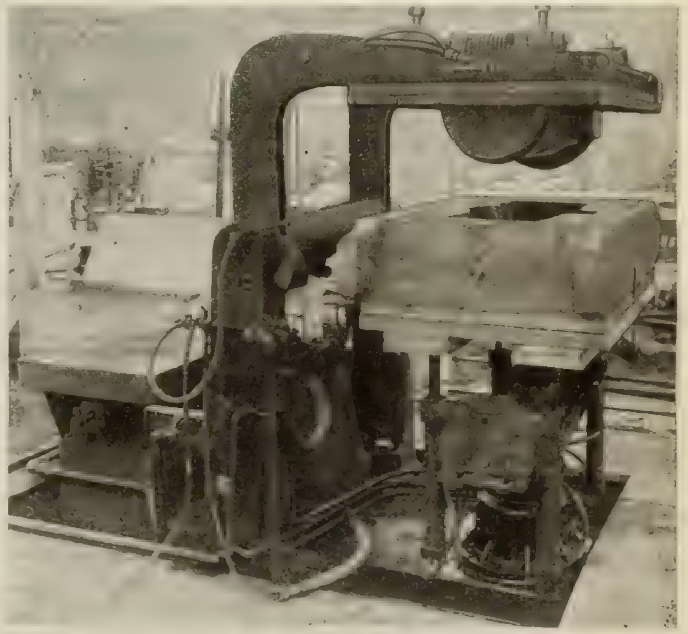
The complete equipment is product of the Metalwood Mfg. Co., Detroit, Mich.

NEW JOLT ROLL-OVER DRAW MOULDING MACHINE

THE accompanying illustration shows a new jolt roll-over draw moulding machine which was exhibited at the recent convention of the American Foundrymen's Association in Cleveland. by the builders. the E. H. Mumford Co., Elizabeth, N.J. A large range of work can be performed in the machine which can take a 37 x 48 in. flask and has a 16-in. draw. The machine is operated in the following manner:—

The pattern board is placed directly on the jolt rammer table by means of a positive spring locking device, thus doing away with the usual floating plate arrangement. After the flash is filled it is rammed up by the jolt machine which is a standard Mumford machine having 10-in cylinder, and capacity to ram half moulds weighing 3,700 lbs. at 80 lbs. air pressure. When the ramming process is complete the mould is clamped to the pattern board, and the rock-over valve is opened. As soon as the arms start upward in the rolling over operation, they are automatically locked to the pattern board by means of sliding pins. This takes place as soon as the arms move upward ¼ in., so all danger of the pattern board slipping is absolutely eliminated. The rolling over operation is accomplished by means of a 16 in. air cylinder acting in both directions on a crank.

When the mould is rolled over it hangs suspended by the arms over the levelling and pattern drawing davice. This device consists of the Mumford fluid pressure plunger, an apparatus which has been thoroughly tested out in the Mumford Split Pattern Machines where it is also used for drawing the pattern. In operation the draw plunger raises up the leveling device to a height of 16 in., the maximum draft, when a stud opens a pop valve reelasing four leveling pins which rise independently of each other until they strike the bottom board of the flask. As they are independent of each other any inequality in the surface of the board is automatically taken up, and the pins being 22 in. in length, no adjustment is necessary for shallow or deep flasks; considerable saving of time is also effected where work of varied depths is being run. When the pins have come to rest under the bottom board they are locked by means of an air clamp from the operating position. This clamp exerts a pressure of three tons



JOLT ROLL-OVER DRAW MACHINE.

on each separate pin, thus assuring a rigid rest for the flask. Hand levers for locking the pattern board to the arms, and also for locking the leveling device, have been entirely done away with. The operator need not move from the valve position to complete every operation.

When the flask has been leveled by the above means, the pattern is then drawn through oil by means of the fluid pressure plunger before mentioned. This device insures a steady even draft under all conditions, as the oil in the cylinder has to pass through a very small hole in order to let the plunger down. The machine is operated by means of only five valves in all, and these are placed in consecutive order so that passing from one operation to the next is easily indicated by their position.

* * *

STEAM TURBINE DRIVEN INDUCED DRAFT FANS

THE high degree of perfection now obtainable in high-speed reduction gears is resulting in the adoption of steam turbines as the motive power for such items of boiler house equipment as induced draft fans. The simplicity and reliability of steam turbines renders them very suitable for boiler-room service, but until high-speed gears were commercially available, their relatively high speed had prevented the extensive use of steam turbines for the fans referred to, as such fans on account of the large volumes handled are usually of relatively slow speed.

Two recent installations of turbine-driven fans are shown in Figs. 1 and 2, the turbines being built by the Terry Steam Turbine Co., Hartford, Conn., and the fans by the Green Fuel Economiser Co., Beacon, N.Y. These fans are driven through herring-bone reduction gears, the unit in Fig. 2 having a ratio of 6.78 to 1, with a maximum pinion speed of 3,630 revs. per min. Fans for this class of work require from 25 to 50 horse-power, and give a draft of from 2 in. to 5 in.

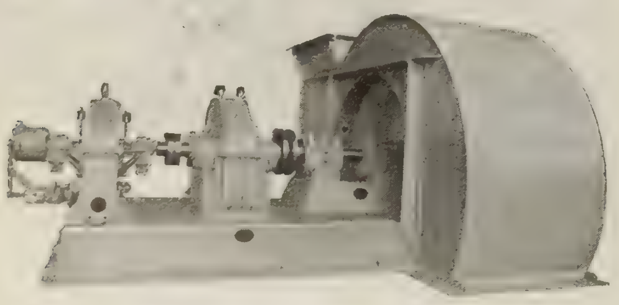


FIG. 1. STEAM TURBINE-DRIVEN INDUCED DRAFT FAN WITH GEAR REDUCTION.

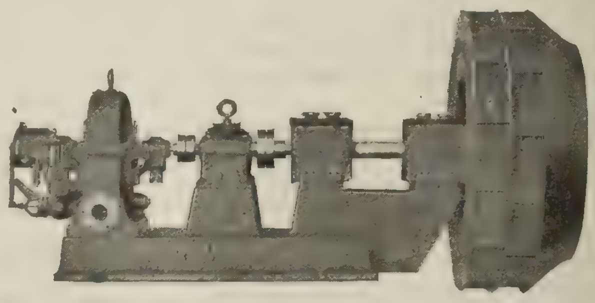

FIG. 2. FAN WITH CASING REMOVED, SHOWING CONSTRUCTION OF IMPELLER.

On account of the warm location the bearings of both fan and turbine are water cooled. The turbines are of the Terry helical flow type in which the steam is passed repeatedly through a single row of moving buckets, this design permitting the use of a wheel made from a single steel forging with buckets milled from the solid.

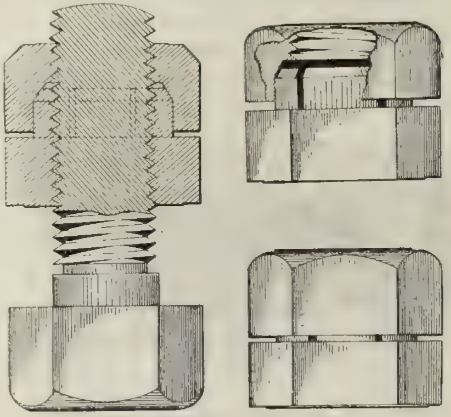
NEW TYPE LOCK NUT

A LOCK NUT in which the dead and not the moving member is locked has been developed by the Western Screw & Lock Nut Co., San Francisco, Cal. With this nut no washers are required and the nut can be locked at any point on the bolt, an arrangement which makes it possible to take care of oscillating or pulsating movements. The bolt and nut can be used over and over several times, it is claimed, without damaging the threads. It is possible also to fit a United States standard nut tightly on a bolt having a V-thread, and it is also possible to make a nut tight on a loose fit bolt.



NEW TYPE LOCK NUT

The lock nut consists of two members. The lower, which is the nut proper, is similar in form to a regular hexagon nut and has four flexible finger members projecting from its upper surface. When the upper or locking member is screwed down, these fingers are compressed and the nut is frozen, as it were, to the bolt. The locking action is secured by turning the locking member firmly. When locked in place this member is counted on to help carry the load. One of the features of the lower member is a number of threads which provide capacity to carry the load. The nut is released with an ordinary wrench, and when the locking member is released it will of course move as one of the ordinary type.

A recent test of the holding power of one of these nuts was made by bolting two pieces of $3/4$ x $1\frac{1}{2}$-in, bar steel together with a $3/4$-in. lock nut and one of the ordinary type placed 6 in. apart. The steel bars were suspended on heavy springs and an air hammer delivered 500 blows per minute with a force of 25 lbs. midway between the two bolts. It is stated that the ordinary nut was jarred off in a short time, thus leaving the strain on the other bolt. After 9 hours of continuous jarring at this rate the lock nut was still gripping firmly.

* * *

SHELL NOSE DRIVING MACHINE

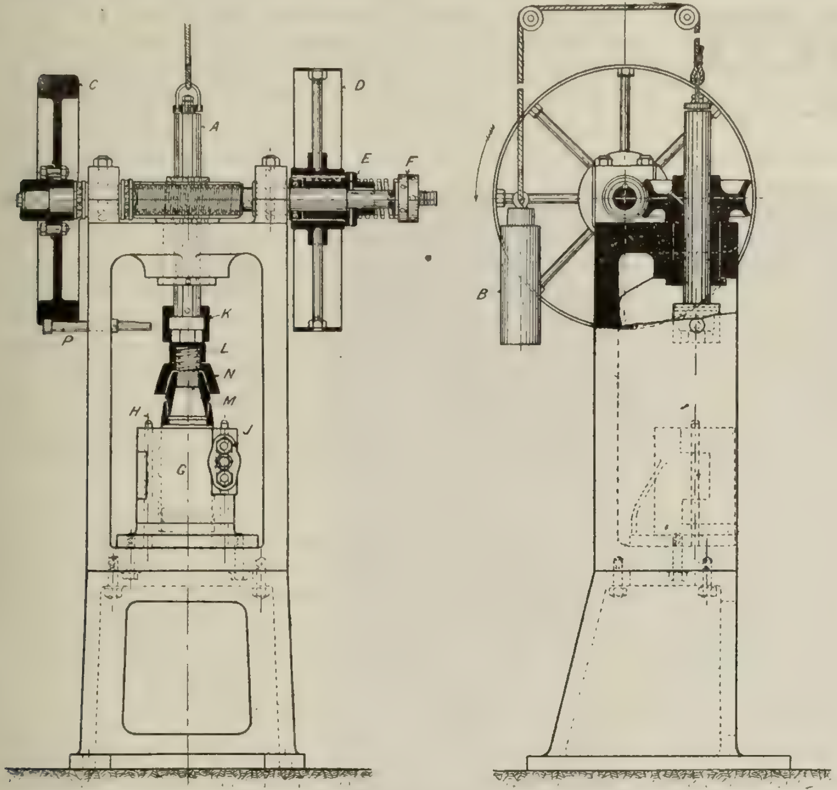
THE accompanying line cut illustrates a machine of British manufacture which has been designed for the purpose of driving on the threaded nose pieces of shells. The compact arrangement calls for comment as also the method of using a fly-wheel for imparting the final jerk which insures perfect tightneess.

The machine consists of a vertical box-shaped frame on top of which is mounted a pulley driven drive shaft carrying a worm which engages with a worm gear carried in the upper part of the frame. Through the worm gear passes the splined shaft A, counterbalanced by weight B. On one end of the drive shaft is secured the fly wheel C, while on the other end is mounted the belt pulley D which drives the shaft through the medium of a spring controlled dog clutch.

The boss of the pulley has beveled clutch teeth formed on it which engage similar teeth on the sliding sleeve E, which in turn is keyed to the shaft and kept engaged with the pulley by means of a helical spring which can be adjusted by nuts F.

According to the pressure of the spring the beveled clutch teeth will disengage at any predetermined resistance, at which point the stored-up energy in fly wheel C comes into play and spends itself in exerting a final effort on the tightened nose piece.

The shell is held in a hinged vise G of a type familiar to shell makers, while the method of driving the nose piece by shaft A is as follows: A hexagonal box coupling K is fixed to the end of shaft A, and engages with the upper end of the blind nut L, the bottom end of which is tapped with a ½ in. pitch right hand square thread. The stud M has its upper end threaded to suit the ½ in. pitch thread, and its lower end is threaded to suit the nose-piece, while passing freely over the stud M is a cup shaped washer N, which is recessed to fit the profile of the nose-piece.



BELT DRIVEN MACHINE FOR TIGHTENING SHELL NOSE-PIECES.

When using the device, the stud M is screwed home within the blind nut L, and washer N slipped over the stud M which is then screwed into the nose-piece after which the shell is placed in the vise, with the nut L engaging coupling K. The driving power of shaft A is now imparted to the nose-piece through the friction of washer N against the nose.

To release the coupling, the nut L is turned back by hand which is readily done, due to the coarse pitch of its thread, compared with the thread in the nose-piece. The stop P holds the shaft A clear of the work while the shell is being adjusted. The makers of this machine are Pollock & Macnab, Ltd., Bredbury, Lancs.

THE WAR AND MERCHANT SHIPPING

ONE thousand eight hundred and twenty ships, with an aggregate gross tonnage of approximately 3,328,584, have been sunk by belligerent nations during the twenty-seven months of war ending November 1, according to figures compiled from cable despatches and mail advices published in New York on November 1, by the Journal of Commerce. The losses during October were larger than for any one of the preceding five months, according to the statistics, amounting to 127 vessels of a total of 227,116 tons gross. The October rate of destruction was considerably in excess of the monthly average throughout the war period. Norway lost the largest number of ships —56, according to the statistics, but their gross tonnage was only 57,333, as compared with Great Britain's total loss of 115,546 gross tons of 38 vessels destroyed.

ZINC MINE DEVELOPMENT IN CAPE BRETON

WHAT is stated to be a very rich zinc deposit is now being opened up by Toronto interests in Cape Breton, about 30 miles north-west of North Sydney, in the heart of the Nova Scotia mining district. Surface showings are rich, and it would appear that an extensive zinc and copper producing mine will be developed as a result of the extensive plan of operations now being prepared.

The main vein on the property is 60 feet wide, and has been opened up for a distance of two miles. The ore is almost solid metal, assay returns showing 34 per cent. zinc, 2½ to 4½ per cent. copper, 10 per cent. lead, 1 pennyweight gold and 10 ounces silver. It is characterized by mining engineers, who have recently made an examination, as one of the most spectacular showings in Canada. A second vein, 15 feet wide, has been traced for 1,000 feet, and carries 34 per cent. zinc, 3 per cent. copper and 2 per cent. lead.

BRITAIN BECOMING INDEPENDENT OF FOREIGN STEEL

DR. ADDISON, one of the chief officials of the British Ministry of Munitions, told a party of journalists visiting Woolwich Arsenal on November 2, that he calculated Great Britain would be entirely independent of foreign steel supplies by March, 1917. During the Somme offensive the expenditure on armaments was about ten times the weekly rate on what it was in the month of January, but there are more filled shells in France now than there were at the beginning of the war. With special reference to the steel supply, Dr. Addison said the more Britain was dependent upon neutral countries the more was she waging war at a disadvantage. One of the advantages of making things at home was to save vast sums of money apart altogether from what was lost on exchange. He gave an interesting forecast, which was that as Britain was providing an extension of steel works at a probable saving of something like six millions a year, she would have provided a programme satisfactorily developed to be entirely independent of foreign steel supplies by March next.

SOME DEMONSTRATION!

A LAWYER tells this story of himself and his efforts to correct the manners of his office boy. One morning the young autocrat came into the office, and tossing his cap at a hook, exclaimed:—

"Say, Mr. Jones, there's a ball game down at the park to-day, and I'm going."

The lawyer thought he would teach him a lesson.

"Harry," he said, "that isn't the way to ask a favor. Now, you come over here and sit down, and I'll show you how to do it."

The boy took the office chair, and his employer picked up the cap and stepped outside. He then opened the door softly, and, holding the cap in his hand, said quietly to the boy in the chair:—

"Please, sir, there is a ball game at the park to-day. If you could spare me, I would like to get away for the afternoon."

Whereupon the boy replied:—

"Why, certainly, Harry; and here is 50 cents to pay your way in."—*N. Y. Times.*

LABOR DILUTION IN METAL-WORKING PLANTS MAKING GOOD

THE employment of female labor in our metal-working industries continues to expand at a satisfactory rate, both as regards numbers of operatives, and individual plants taking advantage of their services. Equally satisfactory are the results being achieved in the matters of product quality and quantity output, so much so that firms who were at one time skeptical of the wisdom of even experimenting with the proposition are now actively preparing to adopt it in generous measure. What has already been accomplished, is, we believe, little criterion of what may be expected within say the next six months or even less. The accompanying data relative to female labor in metal-working industries in Great Britain provides something in the nature of an eye-opener, and in equal degree an inspiration to our plant executives whose energies are being concentrated in the like direction:

According to the president of the Institution of Automobile Engineers, in some of the National factories set up by the Ministry of Munitions the female labor amounts to as much as 95 per cent. of the total. Nor, he says, has dilution only been applied to those classes of work in which repetition by the million or by the thousand takes place. It has been found that very many other classes of work can be done after but short training, by men previously reckoned unskilled, and particularly by women. In engineering shops, women are already doing drilling, boring, shaping, slotting, key-seating, milling, surface grinding, universal grinding, tool-setting, fitting, skilled assembling, and erecting. They are, moreover, making equal progress in such industries as wood-working, aeroplane-building, boiler-making, laboratory work, optical work, and instrument making, as well as in nearly all branches of ordnance, small arms, shell and explosive work.

They have also successfully taken up such occupations as driving overhead traveling cranes, shipyard and building cranes, motor testing, inspecting and testing materials of all descriptions, involving the use of micrometers, verniers, surface gauges, and other measuring instruments, including the slide-rule. So wide, in fact, has the scope of female labor become that a well-known member of the Institution of Automobile Engineers, who has taken a leading part in the dilution campaign, recently stated it to be his firm conviction that, given two more years of war, he could build a battleship, from keel to aerial in all its complex detail and ready for trial, entirely by female labor. Some development!

POST WAR PROBLEM PLANS

IN all discussions of the post war problems that Canada will be called upon to solve, least, if any prominence, is given the possibility of her future development being retarded through lack of co-operation by labor. This is perhaps the most promising feature of the present and future outlook, more or less harsh restrictive measures by trade unions being neither meantime operative nor projected. That considerable importance is attached to the labor outlook in Great Britain is evidenced by the anxiety of manufacturers there to associate themselves in the establishment of a mutual trust and forward effort movement with the representatives of labor.

Just as the institutions and laws of Britain have served as models and patterns in the development of world civili-emergency wares at present. The great essentials of in-examined for landmarks and sign posts whereby the expanding activities of budding nations such as ours may emulate to some extent the achievements of her, the Mother of Nations. Towards the present rather than the past, however, must our attention be directed so that the keen and mature experience available may be advantageously appropriated.

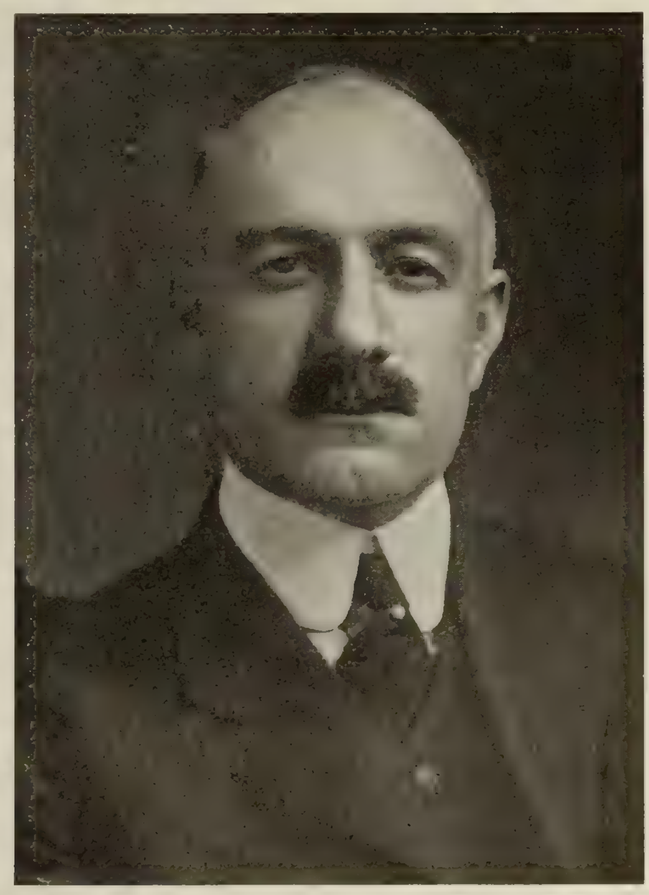
Perhaps the most outstanding feature of the present movement in Britain is the united and whole-hearted manner in which all public bodies, institutes, associations and industrial undertakings are endeavoring to find a solution for the problem of post-war industrial settlement. At a recent conference held at the Mansion House, the Lord Mayor of London moved the following resolution: "That this meeting expresses its appreciation of the great national service being rendered by the munition workers of the country, whose patriotic support of our fighting forces on land and sea is hastening the achievement of final victory, and expresses the hope that permanent remunerative employment will be secured in the vigorous economic development of the engineering industry after the war." The earnestness with which such matters are now regarded is apparent from the fact that presidents and members of more than a score of Institutions, Associations, Universities, Municipal Authorities and Public Companies attended, representing an approximate engineering capitalization of $2,000,000,000.

In order to prevent public demand from drifting back to former foreign channels, it is necessary to realize that the public be educated to the real facts of the situation and be brought to see that self-support, charity notwithstanding, begins at home. Producers must be prepared to devote at least as much energy to the output of staple lines in the future as they are devoting to the output of emergency wares at present. The great essentials of industrial and commercial success are what to make and where to sell, and a proper appreciation of such constitutes the starting point for achievement.

The development of natural sources of wealth is without question the most desirable direction in which Canada can build up a worth-while material prosperity. In his inaugural address as President of the Royal Canadian Institute, a few days ago, Professor J. C. McLennan pointed out that the three chief sources of wealth of this Dominion are agricultural lands, electrical power and mineral deposits. To develop these in the fullest measure, and to the extent which present and pending events indicate as being necessary to meet future world demands—is the work which lies before us, and our engineering industries with their new born sense of fitness and capacity for accomplishment are expected to "blaze the trail."

INDUSTRIAL NOTABILITIES

HENRY DUFF REID, vice-president and treasurer, Reid-Newfoundland Co., railway and steamship owners, St. John's Dry Docks, was born in New South Wales, Australia, Jan. 29, 1869, the son of Sir Robert G. and Harriet (Duff) Reid. In 1873 he came to Canada, receiving in course his education in various Ontario Public Schools. His association with Newfoundland, dates from the year 1890. Prominent among his business experiences and official appointments are the following: Spent three years farming with his father in Northern Minnesota; assisted father and brother in building railways, Cape Breton, N.S., for a short time; his firm undertaking the construction of Hall's Bay Railway and the extension to Port aux Basques, in 1890, and completing same in 1897. He became director, secretary, and assistant general manager of The Reid-Newfoundland Co. formed in 1901, and became vice-president and treasurer on Sir R. G. Reid's death in 1908.



HENRY DUFF REID.

Mr. Reid married Jessie Patterson, daughter of John Patterson, Scotland, Nov. 4, 1894, by whom he has two daughters. His Clubs are: City; St. John's; Golf and Country (life member); Royal Automobile (London, England); his society, A. F. & A. M.; his recreations, golf motoring, fishing, hunting, curling. In politics he is neutral, and in religion, Presbyterian. His address is "Devon Place," St. John's, Newfoundland.

The General Market Conditions and Tendencies

This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents.

Montreal, Que., Nov. 6, 1916.—The abnormal condition prevailing throughout the steel industry is still the dominating factor in industrial circles and receives continual emphasis daily. The scarcity of labor, while not so pronounced as a few weeks ago, is nevertheless sufficient to curtail the maximum possible production.

Pig Iron

The situation in pig iron continues to reflect the pressure under which the steel industry is still working, further advances in many grades being reported. Local dealers are now quoting $31.25 for Victoria, an advance of $1 per ton.

Steel

The demands on producers for shell requirements are so insistent that mills are unable to satisfy the urgent needs of other lines. The increased demand for domestic steel, that is expected to follow the slackening of shell requirements, will prevent any marked decline for some little time. The Pittsburg quotation on sheet bars is now $52 a ton, an advance of $2. Fair-sized business is reported in steel rails. Plates are still active, but the supply is not sufficient to meet requirements. Following the advances that have been prevalent in the States, local dealers have revised their quotations on plates. Sizes ¼-inch to ½-inch are now $5, an advance of 25c per hundred. Heads show an advance of 35c, being quoted at $5.35. Tank plates, 3-16 inch, are $5.25. The market in sheets is very active, but production is somewhat delayed, owing to the scarcity of raw material. An advance of $3 per ton has recently been placed on black sheets, Pittsburg; the price being now $3.75 per hundred. Tin mill black, Pittsburg, is now $4, an advance of $10 per ton. Tin plate shows a similar advance, the current quotation being $6.50. Should the heavy demand for wire products continue, a further advance is anticipated. No definite delivery can be given on iron or steel bars. The Chicago quotation on steel bars is higher, the price of 2.889c being an advance of $2 per ton. Wrought iron pipe and boiler tubes are very active, local dealers having revised their lists on the latter; prices now range from $30 for 1 inch to $60 for 4-inch tubes. A feature of the situation is the high cost of coke, furnace spot being now $7.25, and foundry $8.50 for immediate delivery.

Metals

The general market continues to retain its strong position. Recent activity in copper has added to the strength of this metal. Tin is quiet but firm. Spelter is showing steady improvement, with an undertone of further activity. Lead is quiet, but retains its usual strength. Antimony is dull, and aluminum is quiet, but strong.

Copper.—The recent activity has added strength to the market, slight advances being reported from New York, and the tendency is for still higher prices. The London situation is well maintained, with standard spot showing a slight decline. New York prices have advanced ⅛c on prime lake and ¼c on electrolytic and castings; present quotations being 25⅝c for lake, 29c for electrolytic, and 27⅝c for castings. Dealers here report a very steady market, with prices firm and unchanged at 31c for lake and electrolytic and 30c for castings.

Tin.—Available metal is at present rather scarce, but the visible supply is apparently sufficient to maintain a steady market. Both London and New York have weakened in their latest quotations; the latter having declined ⅛c. lowering the quotation to 41¾c per lb. The local market is unchanged, with prices firm at 45c per pound.

Spelter.—The steady demand is beginning to reduce the supply on the market, and the present undertone points to higher prices. Galvanizers are showing increased interest, and inquiries from these sources are showing improvement. London quotations are a little easier, while New York reports an advance of ⅜c; the current price being 10¾c per lb. The local situation remains unchanged, with prices strong at 13c per lb.

Lead.—The market is very quiet, but firm. Owing to the evident scarcity of nearby metal, the dullness of the present situation has had little effect and prices are being well maintained. Dealers here report prices unchanged at 9c per lb.

Antimony.—Indications point to easier prices, although present quotations are holding firm. New York is still quoting 13¼c; and local dealers are asking 15c on a quiet market.

Aluminum.—The market is not active, but local quotations have again returned to 70c, being an advance of 1c on the week.

Machine Tools and Supplies

While the demand for machine tools is gradually resuming more normal proportions, there is still sufficient business passing to keep builders interested. Standard equipment is still in demand, but the bulk of the inquiries and orders are for special equipment. Owing to the high cost of labor and raw materials, prices on manufactured equipment are well maintained. The continued advance in steel and semi-finished products will probably have an early effect on many of the smaller tools, such as taps, dies, drills, etc.

Scrap

Old materials have continued very firm, and much activity is reported in all lines, more especially in old coppers. Local dealers are quoting higher on light copper, this week's price of 20c showing an advance of 1c per lb. The demand for lead is quite heavy, and prices are stronger by ½c per lb.; heavy lead is now 7c, and tea lead is 5½c. All other scrap is firm at last week's prices.

Toronto, Ont., Nov. 7.—An interesting feature to note is the renewed activity in the machine tool business. The demand for machine tools for shell plants although comparatively good for some time had been gradually falling off, due of course to the fact that practically all the shops were well equipped and only required occasionally an extra machine or so to increase production or as a replacement. The munitions industry now having more nearly got into its stride, the output is rapidly increasing and more orders are being placed for shells. The situation at present seems to be that there is no limit to the orders so long as the output reaches a volume saisfactory to the British Government. Notwithstanding the large number of plants engaged on munitions, new firms are still coming into the arena and the older concerns are extending their plants. This expansion means a bigger demand for machine tools and is the reason for the revival in this important industry.

Steel

The withdrawal of prices in Canada by the U.S. Steel Corporation in their products is the latest development in the steel trade. Not that this makes any material change in the situation, but it is further evidence of the tight conditions which prevail in the steel market all over this continent. The shortage of steel is steadily becoming more acute and may at no distant date assume serious proportions. With the output of shells increasing, the demand for steel for this purpose becomes proportionately greater. The Imperial Munitions Board has the first call on all steel produced and the result is that other branches of the trade suffer. Steel rails for instance are badly wanted but cannot be rolled in large enough tonnages to meet the demand owing to the urgent need for steel for munitions. Prices, although they reached record levels some months ago are still climbing and the mills are getting further behind on deliveries. The demand for ship plates is getting heavier and extraordinary prices are being paid to get quick delivery. Minimum prices quoted are for delivery at mill convenience which would be at least twelve months, the mills being fairly swamped with orders. Lap welded tubes have advanced in the States, so higher prices may be expected here. Wrought pipe has also advanced, affecting lapweld only, owing to the higher prices of raw material. Wire products including wire nails have advanced 15c. All wire products being affected. Plain wire is now $4.40 per 100 lbs. and wire nails $4.10 per keg. The possibility of higher prices on iron bars would affect nuts, bolts and rivets.

CANADIAN GOVERNMENT PURCHASING COMMISSION

The following gentlemen constitute the Commission appointed to make all purchases under the Dominion $100,000,000 war appropriation:—George F. Galt, Winnipeg; Hormidas Laporte, Montreal; A. E. Kemp, Toronto. Thomas Hilliard is secretary, and the Commission headquarters are at Ottawa.

As was anticipated, prices on galvanized sheets have reacted and are now advancing. Prices of black sheets are going steadily upward which is affecting galvanized material. The leading interest in the States recently advanced the price of galvanized sheets $10 per ton; the affect of this is now being felt in this market. "Premier" No. 28 U.S. gauge are now quoted at $6.50, and "Premier" 10¾ oz. at $6.75 per 100 lbs. Black sheets No. 28, gauge are quoted at $4.30, and No. 10, at $5.20 per 100 lbs. The mills are practically sold up on black sheets for the first quarter of 1917.

The steel market in the U.S. is growing stronger and a further advance in finished steel prices is expected soon. Steel companies are getting many orders offered to them, as has been the case for months, which they are not able to accept. The situation is so tight that the principal concern of buyers is to get their orders placed at any price and to hasten deliveries. Export enquiries continue in heavy volume particularly for billets, bars, rails and structural shapes. Chicago warehouse prices have advanced, steel bars being now 3.35c, shapes 3.35c and plates 4c per lb.

Pig Iron

All quotations on domestic pig iron have been withdrawn until further notice pending an upward revision of prices. Pig iron is now being quoted at $27 per ton in Buffalo, N.Y., which is an indication of what local prices will be. The pig iron market is in an excited condition in the States and prices continue to advance. At Buffalo for the first time in years the stocks of pig iron are practically cleaned out and prices are more or less nominal. The serious shortage of coke, labor and cars all go to make up the present strained situation with little or no sign of relief in sight. Grey forge is now quoted at $21.45; Bessemer $26.95; basic $23.95 per ton all f.o.b. Pittsburgh, with high silicon pig $25 to $27, and foundry grades $24 to $26 per ton Buffalo.

Scrap

The market for scrap material is firm and generally steady at unchanged prices. Steel turnings and borings however, are weak as the supply is greater than the consumption. The offerings of this material are heavy but the demand is light. Heavy melting steel continues active and in good demand at unchanged prices, while there is also a good demand for scrap copper.

Coal and Coke

A serious situation has developed in the coal trade owing to shortage and consequent advance in prices. It appears that the comparative scarcity of miners in the coal mining districts in the States has caused a decrease in output and the unusually heavy demand particularly in New England has resulted in a shortage of supply for Canada. With regard to hard coal, if the present shortage becomes more acute, prices will advance. The situation is more serious in soft-coal, supplies are scarce and prices are already advancing. The prices in the current market quotations have been withdrawn pending a return to more stable conditions. The market is very unsettled and prices entirely nominal. The extraordinary prices of coke now prevailing are due principally to car and labor shortages.

Machine Tools

Renewed activity continues in the machine tool market as a result of orders recently placed for shrapnel shells and fuses. Local machinery houses report a brisk demand for screw machines, bench millers and small high speed drills, manufacturers stocks having been practically cleaned out. There had not been a very heavy demand previously for this class of equipment, so dealers had little difficulty in filling orders. The capacity of some of the plants working on 6 in. shells is being doubled and extensions in other plants are frequent, with the result that there has been and still is, a good volume of business passing in machine tools. The recent call for more 18 pounder high explosive shells, a size not now being made here, will create a demand for suitable tools such as were employed when these shells were being produced a year ago. For some time American builders of standard types of machine tools had been getting these made in outside plants owing to the big rush of business. They are now making all their tools again with the result that the quality of the product has improved but deliveries are slower. Canadian machine tool builders are very busy and have all the business they can take care of for months. Prices are still high and in some lines are advancing. In the U.S., machine tool builders in the East have advanced prices 10 per cent. on planers, shapers and radial drills, while one firm has made an increase of 25 per cent. on boring and turning mills. Advances on several machines have also been made by manufacturers in the Middle West. There is little change in the situation as regards deliveries. Milling machines can be obtained in about six months. Small lathes, radial drills and some machines of lighter type are fairly easy to obtain, but deliveries on heavy equipment, such as heavy lathes and planers run into eight or nine months.

Supplies

There is practically no change in the situation. Business continues good and prices are very firm with a decided upward tendency. Stocks on some lines of supplies are low on account of slow deliveries.

Metals

The metal markets continue steady and in most cases firm, antimony being the only metal to show any indication of weakness. The copper situation is still the principal feature of interest and higher prices are looked for. The demand for copper is very heavy and few producers hold any metal for the first quarter of 1917. Tin advanced sharply a few days ago in London but local prices have not been affected as yet. The spelter situation has improved and quotations are holding firm with producers still disinclined to sell freely. Antimony is easy and business quiet, while aluminum is firm at unchanged prices.

Copper.—The export and domestic demand for copper continues heavy, and some sellers have disposed of all their production up to July 1917, while few have any metal for sale until after the first quarter. Some sellers report that the volume of business is only limited by the amount of copper available. Consumers are taking copper wherever they can secure it regardless of price. The market is thus very strong and a further advance would not be surprising. Local quotations are firm at 31c per pound for lake and electrolytic, and 30c for castings copper.

Tin.—Although tin advanced recently in London, the reason not being explained, the local market is unchanged. The situation in New York appears to be somewhat complicated and the increase in the visible supply has not depressed the market as is usually the case. Permits to ship tin from London to New York are still difficult to obtain. Local quotations are firm at 46c per pound.

Spelter.—The market continues strong and producers are reported to be still disinclined to sell freely, believing that prices will go higher as the price of ore has advanced about $7.50 per ton, thus increasing the cost of producing spelter. Prices are firm locally and unchanged at 14c per pound.

Lead.—Quotations are firm but the market continues quiet, although there are indications of more activity in the near future. The leading interest continues to quote 7c New York. Lead is unchanged at 9c per pound.

Antimony.—The market is easier and business dull. Quotations are unchanged at 18c per pound.

Aluminum.—The demand is rather quiet but the market is steady at unchanged quotations. Local price 68c per pound.

Pig Iron Advance

As we go to press, word has been received that "Hamilton" pig iron has advanced $2 per ton.

SHIPPING AND WAR

IT is no longer a novelty to learn of ships earning their first cost from one year's freights. In the past two years freights have doubled, trebled and in certain instances increased ten-fold over the figures which obtained at the outbreak of the war. While high cost of labor and materials, reflected in operating costs, have had an influence in increasing freight rates, the three main causes are the requisitioning, especially by the British Government, of merchant vessels for war purposes, the internment of ships of the Central Powers, and the decrease in tonnage due to the submarine campaign. Over fifty per cent. of British registered tonnage has at some time or other been devoted to the military needs of the Allies. It is estimated that during the war period, the steam tonnage on Lloyd's Register as of July, 1914, has been reduced from 24,809,000 tons of 13,158,000 tons. In other words, making due allowance for new tonnage added, the depletion through Government requisitions, internment and war losses, has cut the available tonnage practically in two. The tremendous demand for cargo space has put into commission, on a very profitable basis, vessels which prior to the war could hardly pay their keep. This movement, while applying generally to neutral shipping is specially marked in the United States and the Scandinavian countries.

LACHINE CANAL DURING OCTOBER

LESS than one-fourth of the wheat came through the Lachine Canal during the month, which ended recently, than came through in October, 1915. The 1,399,038 bushels of wheat which came in lake boats and barges during October seems a small amount as compared with the 5,635,688 bushels taken through the canal in the same month last year. The only other decreases among the grains were in corn and flaxseed, neither of which came down at all, while last year in October the total was 68,081 bushels of corn and 41,602 bushels of flaxseed. Oats and barley, however, show the following splendid increases as between October in 1915 and 1916 respectively: Oats, 475,759 bushels and 1,238,902 bushels, increase 763,143 bushels, and barley, 211,115 and 474,018, increase 262,903 bushels. The total of all grains brought down the canal is half the amount carried last year for October, as follows: October, 1915, 6,432,245 bushels; October, 1916, 3,111,958 bushels; decrease, 3,320,287 bushels.

Less Produce Carried

The total grain brought down during the season up to October 31, amounted to 22,405,114 bushels, being 13,280,174 bushels less than the amount brought down during the same period last year. Just as during other months of this season, there is almost as great an advance in the amount of coal brought down as there is a decrease in the amount of grain. The number of tons carried last month was 224,646, as against 128,779 for October, 1915.

Eggs, cheese, butter and apples have been carried in much smaller quantity. decrease in apples and butter being nothing short of astonishing. As for flour, none was carried at all, as compared with 49,800 sacks a year ago. The comparative statistics for the Octobers of 1915 and 1916 respectively are as follows: Cases of eggs, 341 and 256; packages of butter, 317 and 123; boxes of cheese, 31,423 and 29,065, and barrels of apples, 14,067 and 2,650, a decrease of 11,417 barrels.

During the month there were fewer trips, less tonnage operated, fewer passengers carried, and less cargo tonnage than in October, 1915. The statistics for the two months follow: Number of trips, 1,123 and 977; tonnage operated, 573,729 and 500,204; passengers carried, 757 and 697; cargo tonnage, 487,905 and 431,992; and number of trips light, 455 and 391.

⁂

TRADE OF NEWFOUNDLAND

THE imports into Newfoundland in 1915 were valued at $12,350,786, representing a decrease of $2,842,940, compared with the imports of 1914. This decrease was shared in by practically every country exporting goods to Newfoundland. The imports from the United States decreased from $5,796,906 to $4,943,752; from Canada from $4,861,047 to $4,509,827; from the United Kingdom from $3,826,529 to $2,311,945; from British West Indies from $222,801 to $214,202; from Spain from $113,541 to $83,215, and from Germany from $59,145 to $10,343.

The decrease in the imports into Newfoundland of $2,842,940, from 1914 to 1915, but principally due to the decreased importations of the following articles: Beef, salted in barrels, $652,642 to $465,140; boots and shoes, $216,571 to $132,188; blankets, quilts, carpeting, etc., $478,977 to $268,078; clothing, $337,204 to $207,296; coal: $1,005,762 to $719,189; cotton fabrics, $331,131 to $231,206; groceries, $230,601 to $168,966; hardware, $370,135 to $212,124; hemp and coir yarn, $250,959 to $149,057; machinery, $769,737 to $414,811; medicines, $187,412 to $87,837; oxen, cows and horses, $166,570 to $95,468; paints, $147,979 to $92,314; pork, $822,191 to $642,911; railway materials, $287,368 to $137,297; and tweeds, cloths, doeskins, etc., $187,444 to $85,913. Articles for the army and navy, and flour were the only items to show substantial gains, these increasing from $15,478 to $219,555, and flour from $1,823,551 to $2,168,573.

⁂

CONSERVATION OF PULP WOOD

THE disappearance of the wood pulp supply in Canada during the next twenty-five years, if conservation measures were not adopted, was prophesied at a recent session of the Dominions Royal Commission by Ellwood Wilson, an expert on the paper industry. Three things were essential to the protection of the pulp industry—the adoption of a scientific scheme of reforestation, a proper system of fire protection, such as has been adopted in British Columbia, and also a system that would do away with the dangerous disposal of waste that now prevails in the forests. During the past thirty-five years thirty per cent. of the pulp wood lands of Canada had been burned over and rendered useless for generations to come.

Carl Riordon explained how the long haul to Europe with its consequent high freight rates made it almost impossible for Canadian paper or pulp manufacturers to compete with the manufacturers of pulp in Europe, who are located principally in Sweden and Norway. When the war was over it was expected, with the higher taxes that would prevail in Europe, the higher cost of production and the higher cost of capital, that the price of the European pulp would increase materially, giving the Canadian a new field.

⁂

INCREASED VALUE OF CANADIAN FISHERIES

CANADA possesses the most extensive fisheries in the world, and the waters in and around Canada contain the principal commercial food fishes in greater abundance than the waters of any other part of the world. Apart from salmon, all the lobsters, herring, mackerel and sardines, nearly all the haddock, and many of the cod, hake and pollock landed in Canada are taken from within our territorial waters. There is a coast line of 5,000 miles on the Atlantic side, 7,000 miles on the Pacific, and 220,000 square miles of fresh water, stocked with many species of excellent food fishes.

During the fiscal year ended March 31, 1916, the total marketed value of all kinds of fish, fish products and marine animals taken by Canadian fishermen was $35,860,000, being an increase of $4,596,000 over the 1915 figures. British Columbia was responsible for $3,023,000 of the year's increase. Salmon was the chief product, representing a value of $11,262,000; lobster came next with $4,506,000; cod, $4,489,000; herring, $2,,906,000; halibut, $2,261,000; haddock, $1,232,000; sardines, $1,229,000; whitefish, $1,048,000. Oysters had a value of $147,628.

The production by provinces, according to the Government records, is as follows:—

Province.	Value Produced.	Increase.
British Columbia	$14,538,320	$3,023,234
Nova Scotia	9,166,851	1,436,660
New Brunswick	4,737,145	*202,998
Ontario	3,341,182	585,891
Quebec	2,076,851	152,421
Prince Edward Island .	933,682	*327,984
Manitoba	742,925	*106,497
Saskatchewan	165,888	33,871
Alberta	94,134	7,414
Yukon	63,730	*5,952
Totals	$35,860,708	$4,596,077

*Decrease.

⁂

TRADE INQUIRIES

THE following inquiries relating to Canadian trade have been received by the Department of Trade and Commerce, Ottawa.

1173. Representation —. A civil engineer who has had wide experience in the construction of municipal waterworks, gas works and sewers in Canada the United Kingdom and South Africa would like to make arrangements with a Canadian manufacturing concern to represent them as a commercial traveller in England, France, Belgium, Serbia, Russia or elsewhere.

1284. Machinery—Ore-Crushing.—A Johannesburg firm makes inquiry for machinery suitable for crushing and fibreizing asbestos. Sample of their worst raw fibre is on file with the Department at Ottawa.

1220. Cobalt and Nickel Ores.—A London manufacturing company asks to be placed in direct touch with Canadian producers of both cobalt and nickel ores.

1224. Representative.—An engineer who has held very important positions in charge of municipal construction work, such as water-works, gas-works, sewers, street improvements, etc., in the United Kingdom, South Africa and Canada, desires to act as a representative of a Canadian manufacturing firm or a combination of Canadian manufacturers during the reconstruction period after the war.

1231. Iron Wire, Galvanized Barbed Wire, Wire Nails, etc.—A Leeds firm is open to buy carload lots of galvanized barbed wire, galvanized fencing strand wire, and wire nails and are also interested in galvanized staples and iron wire.

1429. Engineering Supplies. — An Orange Free State firm of engineering specialists in refrigerator plants and pumping machinery requests catalogues and all other particulars in above lines and valves, joistings, boring drills, pumps, cylinders, pulleys and piping.

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News

Engineering

New Glasgow, N.S.—The Eastern Car Co., are installing a drop forging plant and an electric furnace.

Hawkesbury, Ont. — The Riordon Paper Co., propose extending their boiler and pumping plant here.

Regina, Sask.—Fire on Oct. 29, destroyed the electric light plant at Grand Coulee, a few miles west of here.

Niagara Falls, Ont.—The Canadian Aloxite Co., have commenced the erection of an addition to their plant to cost about $30,000.

St. John's, Que.—Fire recently damaged the St. John's Machine & Tool Co. plant, the loss being about $12,000, only partly covered by insurance.

Port Arthur, Ont.—The Fegles-Bellows Co., who propose to erect a factory near the site of the Conley Frog and Switch plant, request the immediate construction of a bridge over the McIntyre river at that point. They are going ahead with their construction earlier than was intended.

Port Colborne, Ont.—The International Nickel Co., has completed the surveys for its refinery at Port Colborne, and is now beginning excavation work in order to have the foundation completed before frost sets in. The company has set aside five million dollars for this plant. The Foundation Co., Montreal have the contract for the foundation.

Halifax, N.S.—H. R. Mallison of the Halifax Electric Tramway Co., announced recently that the company proposed spending $1,500,000 on the extension and improvement of gas mains, electric power facilities and tramway extensions. The hydro-electric development in the Gaspereaux will probably be proceeded with soon. The gas plant will have a capacity twice greater than the present one. Upon the extension of the plant and mains one hundred thousand dollars will be spent.

Renfrew, Ont.—Power development works have been commenced by M. J. O'Brien of Renfrew at Calabogie village, situated at the foot of Lake Calabogie, an expansion of the Madawaska River. It is the intention to build dams and erect a power-house for the generations of 5,000 h.p. which will be transmitted either partly or wholly to Renfrew, a distance of twenty miles. A dam twenty-eight feet in height will be built on the site of an old mill of the pioneers, and beside it will be the power-house. The total cost of the whole development will approximate half a million dollars.

Municipal

Calgary, Alta.—It is proposed to submit a by-law to the ratepayers to authorize the installation of a water filtration plant.

Port Colborne, Ont. — A by-law has been passed here granting fixed assessment for a number of years to the International Nickel Co. for its refining plant.

General Industrial

Fort William, Ont.—The Barnet & McQueen Co., are the contractors for the extension to the Ogilvie Milling Co. elevation here.

Valleyfield, Que. — The Gold Lion Brewery was practically destroyed by fire on Oct. 31. The blaze is supposed to have originated in the engine-rooms. The damage is estimated at about $150,000.

New Incorporations

The New Westminster Foundry Co., of New Westminster, B. C. has been inorporated with a capital of $10,000.

The Universal Smokeless Heat Generator Co. of Victoria, B. C. has been incorporated with a capital of $50,000.

Foundry Products, Ltd., has been incorporated at Ottawa, with a capital of $500,000, to carry on business as iron founders and steel makers, etc., at Calgary, Alta. The incorporators are: Daniel L. Redman, Charles W. Coole, and Peter D. McAlpine, all of Calgary, Alta.

Dominion Fire Brick & Clay Products, Ltd., has been incorporated at Ottawa, with a capital of $500,000, to manufacture fire brick and clay products of all kinds at Moose Jaw, Sask. The incorporators are: H. G. Love, A. Hitchcock and Edward C. Mathews, all of Moose Jaw.

The Shell Bar Grate Co. has been incorporated at Toronto, with a capital of $40,000, to manufacture a patent boiler grate and to carry on business as iron founders and mechanical engineers at Tôronto. The incorporators are: J. Max Bullen, Harold L. Steele and Wendell Osborne, all of Toronto.

The Sterling Engine Works, Ltd., has been incorporated at Ottawa, with a capital of $25,000, to manufacture steam and gasoline engines, and boilers, etc., at Winnipeg, Man. The incorporators are: Vincent C. Maddock, William J. Leaney and Garnet Coulter, all of Winnipeg.

The Dominion Crucible Co. has been incorporated at Ottawa, with a capital of $200,000, to manufacture crucibles, graphite, clay and refractory materials, with head office in Montreal. Incorporators are: F. G. Bush, G. R. Drennan, and H. W. Jackson, all of Montreal.

The Kingston Smelting Co. has been incorporated at Toronto, with a capital of $30,000, to carry on the business of mining and smelting ores at Kingston, Ont. The incorporators are: Alexander McKinnon, J. L. Whiting and David Murray, all of Kingston, Ont.

Contracts Awarded

Oshawa, Ont.—The Toms Contractin Co., Toronto, has been awarded contracts for additions to the plant of th Chevrolet Motor Co., Oshawa.

Toronto, Ont—A contract has bee awarded by the Board of Control t Drummond, McCall & Co., Toronto, fo six valves.

Assiniboia, Sask.—The Town Counci have let the following contracts for th construction of a waterworks system One internal combustion engine, Bovin Co. of Canada, Ltd., Lindsay, Ont.; generator, switchboard, and other apparatus, Canadian Westinghouse Co. pumps, motors, piping, and air compressor, James Ballantyne & Co.; on pneumatic storage tank, Canadian Allis Chalmers, Ltd.; poles, wire, and lin material, Northern Electric Co.; abou 17,500 feet of cast iron or steel pipe an specials, Canada Iron Foundries; hydrants, gate valves, and boxes, T. McAvity & Sons.

Enlarged Canadian Trade Intelligence Service

Under the arrangement made by the Minister of Trade and Commerce with Sir Edward Grey in July, 1912, the Department of Trade and Commerce, Ottawa, is able to present the following list of the more important British Consulates whose officers have been instructed by the Foreign Office to answer inquiries from and give information to Canadians who wish to consult them in reference to trade matters.

BRAZIL
Bahia, British Consul.
Rio de Janeiro, British Consul General.

CHILE
Valparaiso, British Consul General.

COLOMBIA
Bagota, British Consul General.

ECUADOR
Quito, British Consul General.
Guayquil, British Consul.

EGYPT
Alexandria, British Consul General.

FRANCE
Havre, British Consul General.
Marseilles, British Consul General.

INDIA
Calcutta, Director General of Commercial Intelligence.

ITALY
Genoa, British Consul General.
Milan, British Consul.

MEXICO
Mexico, British Consul General.

NETHERLANDS
Amsterdam, British Consul.

PANAMA
Colon, British Consul.
Panama, British Vice-Consul.

PERU
Lima, British Vice-Consul.

PORTUGAL
Lisbon, British Consul.

RUSSIA
Moscow, British Consul General.
Petrograd, British Consul.
Vladivostock, British Consul.
Odessa, British Consul General.

SPAIN
Barcelona, British Consul General.
Madrid, British Consul.

SWEDEN
Stockholm, British Consul.

SWITZERLAND
Geneva, British Consul.

URUGUAY
Monte Video, British Vice-Consul.

VENEZUELA
Caracas, British Vice-Consul.

CANADIAN COMMERCIAL INTELLIGENCE SERVICE

The Department of Trade and Commerce invites correspondence from Canadian exporters or importers upon all trade matters. Canadian Trade Commissioners and Commercial Agents should be kept supplied with catalogues, price lists, discount rates, etc., and the names and addresses of trade representatives by Canadian exporters. Catalogues should state whether prices are at factory point, f.o.b. at port of shipment, or, which is preferable, c.i.f. at foreign port.

CANADIAN TRADE COMMISSIONERS.

ARGENTINE REPUBLIC
H. R. Poussette, Reconquista, No. 46, Buenos Aires. Cable address, Canadian.

AUSTRALIA
J. H. Ross, Stock Exchange Building, Melbourne. Cable address. Canadian.

BRITISH WEST INDIES
E. H. S. Flood, Bridgetown, Barbadoes, agent also for the Bermudas and British Guiana. Cable address, Canadian.

CHINA
J. W. Ross, 13 Nanking Road, Shanghai. Cable address, Cancoma.

CUBA
Acting Trade Commissioner, Lonja del Comercio, Apartado 1290, Havana. Cable address, Cantracom.

FRANCE
Phillipe Roy, Commissioner General, 17 and 19 Boulevard des Capucines, Paris. Cable address, Stadacona.

JAPAN
G. B. Johnson, P. O. Box 109, Yokohoma. Cable address, Canadian.

HOLLAND
Acting Trade Commissioner, Zuidblaak, 26, Rotterdam. Cable address, Watermill.

RUSSIA
C. F. Just, Canadian Government Commercial Agent, Alexandrivskaya, Ploshch 9, Petrograd.
L. D. Wilgress, Canadian Government Commercial Agent, Bukhgolza Ulitza No. 4. Omsk, Siberia.

NEWFOUNDLAND
W. B. Nicholson, Bank of Montreal Building, Water Street, St. John's. Cable address, Canadian.

NEW ZEALAND
W. A. Beddoe, Union Buildings, Customs Street, Auckland. Cable address, Canadian.

SOUTH AFRICA
W. J. Egan, Norwich Union Buildings, Cape Town. Cable address, Cantracom.

UNITED KINGDOM
Harrison Watson, 73 Basinghall Street, London, E.C., England. Cable address, Sleighing, London.

N. D. Johnston, Sun Building, Clare Street, Bristol. Cable address, Canadian.

J. E. Ray, Central House, Birmingham. Cable address, Canadian.

J. Forsyth Smith, 27-28 Pearl Building, East Parade, Leeds. Cable address, Canadian.

F. A. C. Bickerdike, Canada Chambers, 36 Spring Gardens, Manchester. Cable address, Cantracom.

J. T. Lithgow, 87 Union Street, Glasgow, Scotland. Cable address, Contracom.

SPECIAL TRADE COMMISSIONER—LUMBER

H. R. McMillan, visiting Europe, Africa, Australasia and the Orient.

CANADIAN COMMERCIAL AGENTS

AUSTRALIA, B. Millin, Sydney, N.S.W.

CANADIAN HIGH COMMISSIONER'S OFFICE

UNITED KINGDOM
W. L. Griffith, Secretary, 17 Victoria Street, London, S.W., England.
Cable address, Dominion, London.

Tenders

Weir, Que.—Tenders for furnishing all labor and materials and constructing a steel bridge and appurtenances to be erected over the Rouge River (Rivington Bridge), addressed to the undersigned, will be received by the Municipal Council of Harrington until December 2, 1916. All tenders shall be in accordance with the plans and the specifications prepared by the engineer of the Department of Public Works and Labor, and which may be seen at the office of the undersigned, Pierre Cantin, treasurer, P.O. Box 44, Weir, Que.

Ottawa, Ont.—Tenders, addressed to J. W. Pugsley, secretary of the Department of Railways and Canals, Ottawa, Ont., will be received up to November 15 for the construction of a reinforced concrete elevator with a capacity of 500,000 bushels. Plans, specifications and blank form of contract may be seen at the office of the following:—Chief engineer, Department of Railways and Canals, Ottawa; railways, Moncton, N.B., general superintendent, Winnipeg, Man.; resident engineer, Fort William, Ont.; John S. Metcalfe Co., engineers, Montreal, Que. Contractors who wish to obtain plans and specifications temporarily for their own use may obtain same on depositing a certified bank cheque for $100.

Marine

St. Catherines, Ont.—A serious accident occurred on the Welland Canal on Nov. 5 when the steamer J. H. Shrigley of Sarnia carried away both foot gates of lock 7, flooding the country in the vicinity.

New Glasgow, N. S.—The Nova Scotia Steel and Coal Co. have decided to enlarge their shipbuilding activities by building a second ocean going vessel, and one about 25 per cent. larger than that now under construction.

Kingston, Ont.—The steamer John F. Thom, belonging to the Thom Transportation Co. of Quebec, which recently went aground on the westerly end of Corrigan's Island, near Waddington, will be left in its present position until Spring.

Brantford, Ont.—With a view to the improvement of the Port Dover harbor Government officials paid a visit there on Saturday and gathered data to prepare plans for its deepening. Chief Engineer Stephen, of the Windsor office of the Department of Public Works; Martin N. Todd, general manager of the Lake Erie and Northern Railway, accompanied by Senator McCall, of Simcoe, comprised the party.

Victoria, B.C.—The first and most important section of Victoria's greater harbor scheme is now practically complete. The huge breakwater, which is constructed of granite and reinforced concrete 2,500 feet to seaward, has reached such a stage that within four weeks the contracting firm, Sir John Jackson, Ltd., will have completed the undertaking. The contract has been under way for the past three and a half years, initial operations being started in April, 1913, and continuous progress has been maintained. When the entire scheme is completed, Victoria will have one of the finest harbors, equipped with the finest facilities for handling large ships on the entire coast. Rapid progress is being made by the firm of Grant Smith & McDonnell in the construction of the two concrete piers sheltered by the breakwater. The whole of the fifty-two reinforced concrete caissons required for the contract have been completed and, with the exception of one, all have been sunk in position on the site. At low water the outline of the piers can be clearly distinguished.

Railways—Bridges

Russian Railroad Construction. — Foley, Welsh & Stewart, Canadian railroad builders, have their men at work on the contract for 3,000 miles of railroad in European Russia which they recently secured. Preliminary surveys are being made, and it is thought that by spring the actual construction will have begun.

Railroad Contracts Pending.—Railroad construction contracts, totalling 28,000 miles in Russia and China, are pending, and even that amount is said to represent only a small part of the future development in this respect. A conservative estimate places the railroad construction in Asiatic China and Russia at from 60,000 to 70,000 miles in the next decade.

Personal

W. M. Neal has been appointed acting superintendent C.P.R. car service, vice H. J. Humphreys, transferred.

Lionel L. Gisborne, formerly assistant waterworks engineer at Ottawa, has been appointed manager of the Toronto office of the General Supply Co., of Canada. The office is located at 38 Toronto Street.

E. R. Wood, Toronto, has complete charge of the institution of the Canadian Aviation school being established in Toronto by the Imperial Munitions Board. **Lord Innes-Ker** represents the British Government.

H. P. Hoag, superintendent of Goold, Shapely & Muir Co., Brantford, Ont., has resigned to go to a munition factory in Toronto. He was given a chest of silver by the employees as a token of regard.

Senator Wilson, of Montreal, and **C. S. Wilcox** and **Paul J. Myler**, of Hamilton, have been elected to the board of North American Pulp & Paper Co. This concern controls three pulp and paper mills in Canada and the United States, and has extensive limits in Canada.

E. P. Mathewson has been appointed to the position of general manager of the British American Nickel Corporation's plant at Sudbury, Ont., Mr. Mathewson was formerly manager of the reduction works of the Anaconda Copper Co.

William T. Banfield has finished his engagement as production manager with the International Arms & Fuse Co., Bloomfield, N.J., and has returned to Toronto to resume his former duties as a member of the firm of Banfield & Sons, engineers.

J. S. Dennis, assistant to the president of the C.P.R., who for many years, has been in Calgary as head of the company's Department of Natural Resources, has been transferred to Montreal. Mr. Dennis, it is understood, will retain his connection with the Department of Natural Resources in an advisory capacity, but the administration of the department will be turned over to **P. L. Naismith**, who has been manager for some years. Mr. Dennis comes to Montreal as assistant to Lord Shaughnessy, to take up special duties, among which are the important questions of colonization and the development of the resources of the Dominion adjacent to the company's system.

Trade Gossip

The Reliance Mfg. Co. has increased its capital stock to $500,000.

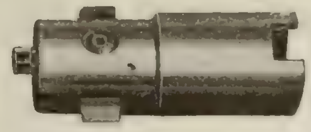
Montreal, Que.—Vickers, Ltd., have an order for two 7,000-ton steamers for Norwegian owners.

The National Iron Works Ltd., Toronto have been awarded a contract by the Toronto Board of Control for cast iron pipe .

Heavy Ore Shipments.—An increase of more than 11,000,000 tons to shipments of iron ore from Duluth, Minn., is shown in reports for the season ended Nov. 1, as compared with the rcords of the corresponding period last year. Up to Nov. 1, 1915, shipments amounted to

Rough Bore, Straight Diameter.

Rough Bore, Inside Radius.



Finish Bore, Straight Diameter.

Finish Bore, Inside Radius.

8" Shells

50% Boring Economy!

9.2" Shells

High-salaried men are employed to keep the cost of production down, but in this case a boy could see the advantages to be obtained through these boring heads.

25% to 50% reduction is obtained only by the use of Davis Boring Heads. These consist of 16 sizes and 26 different styles, and embrace every operation from a shell of the smallest calibre to 8" and 9.2". (The quality of work produced is limited, and that limit is highest quality.)

Davis Boring Heads are constructed of high-speed steel and are the result of years of scientific knowledge of boring-tool requirements and the experience obtained by the "pioneering" days.

WRITE FOR PARTICULARS.

The heads illustrated here are used for operations on 8" and 9.2" shells. The heads are all equipped with micrometer adjustments. This enables more speed to be put to the operation, leaving the adjusting of the cutters to the micrometer.

372 Pape Avenue, Toronto, Can.

29,345,174 tons, while during the 1916 season 40,608,767 tons have gone forward.

Canadian Allis-Chalmers Ltd., Toronto, have been awarded a contract for pumping equipment for the town of St. Marys, Ont.

The Lyman Tube & Supply Co., 33 Melinda Street, Toronto have appointed H. E. Breuls their city salesmon. Mr. Breuls is specializing on chain drives.

Charles C. Kawin Co., chemists and metallurgists, have extended their office and laboratory accommodation in the Kent Building, Toronto, in order to take care of increasing business.

The John Bertram & Sons Co., Dundas, Ont., will open a sales office in the C.P.R. Bldg., Toronto about Dec. 1. They will carry in stock a full line of Pratt & Whitney small tools. John Ferguson of their headquarters staff will be in charge.

The Lyman Tube and Supply Co., 323 St. James St., Montreal have opened a New York office for the purpose of purchasing machinery and other equipment for the benefit of their customers and so that material can be shipped from stock. K. E. Gury, formerly with the Driggs Ordinance Co. will be in charge of the New York office, located at 2606 Equitable Bldg.

The Normac Machine Co., St. Catherines, Ont., have equipped a factory for the manufacture of taps, dies, jigs, gauges, fixtures and all kinds of tools. The members of the new firm are J. H. McCoy and S. A. Norton. Both are men of long experience, Mr. McCoy being formerly connected with the National Cash Register Co. and Mr. Norton with the Whitman & Barnes Co.

Kingston, Ont.—The repair work on the North American smelter, which was recently taken over by the Kingston Smelting Co., is being rushed to completion, and it is expected that the plant will be in operation in three or four weeks. The capacity of the smelter will be about twenty tons a day. The company has not found it necessary to install any new machinery, the old equipment being thoroughly adequate for the work required of it when put into a state of repair. The company intend to smelt lead concentrates into lead, for which there is a splendid market in Canada.

Britain's Output of Munitions.—H. E. Morgan, one of the directors of the Labor Supply Department of the Imperial Ministry of Munitions, is at present in Ottawa, giving to the Imperial Munitions Board, the benefit of his knowledge and experience of labor problems in the munition factories of Great Britain. He says that the output which

$5 a ton for steel billets, which are now held at $50 a ton, Pittsburg. The present outlook may portend still higher in 1914-15 took twelve whole months to produce can now be obtained from British sources in from four days to three weeks, depending upon the class of product. The total number of war workers in 1914 was under 200,000, to-day it is 2,500,000.

Power Hack Saws and Grinder.—The Perfect Machine Co., Galt, Ont., have issued a catalogue dealing with an interesting line of power hack saws, grinders, lathes and drills. The various types of machine are illustrated accompanied by a specification of each and their principal constructional features.

Pulp Wood May Be Scarce.—The disappearance of pulp wood in Canada during the next twenty-five years, if conservation measures are not adopted, was prophesied before the Dominions' Royal Commission at its session in Montreal on Oct. 31, by Ellwood Wilson, an expert on the paper industry. Mr. Wilson stated that there were three things indispensable to the progress on the pulp industry in this country; one was the adoption of a scientific scheme of reforestation; another a proper fire protection system such as they have in British Columbia, and also a system of avoiding wastage.

Serious Coal Shortage.—According to a statement issued on Nov. 1, at Wilkesbarre, Pa., by the Anthracite Bureau of information, which is maintained by mining companies in the hard coal fields, the production of anthracite from April 1 to September 30, this year, was 2,075,000 tons less than in the corresponding months of 1915. This decrease, the statement says, has been due almost entirely to the shortage in the labor supply. During this period there has been no time when there was a surplus of coal on the market. Officials of the Mine Workers' Union are blamed New York office for the purpose of purmands for anthracite.

Twist Drill Manufacture.—I am convinced, says Seymour Bingham, in the "Ironmonger," that Britain will never rise to the occasion to make jobbers' drills to compete with the Germans; firstly, because the trade unions will prevent British makers employing female labor; and, secondly, because failing this, male labor will make the drills too dear to compete. I am so convinced of this that I am putting down a drill works here (Italy), where I can secure cheap female labor and cheap hydro-electric power, and where taxes (compared with Great Britain) are low. In addition, the Italian Government will allow entry of all my plant duty free in order to encourage new industries.

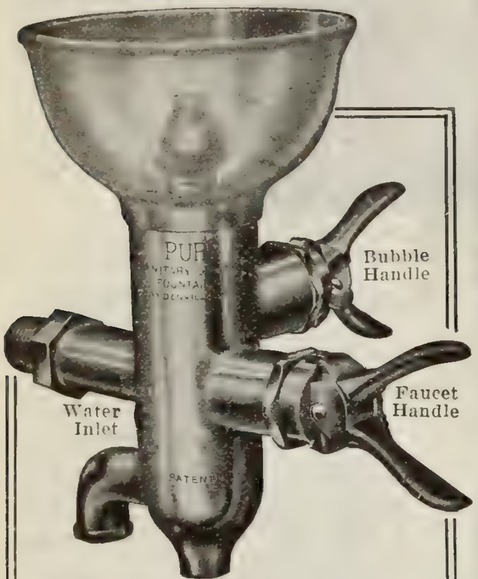
I BELIEVE

In Safety First and always.
In providing for the Health of my Fellow Workmen.
In Light and Air and sanitary Working Conditions.
In clean, fresh drinking water for everybody.
In the Safety, Economy and Man-betterment.

PURO SANITARY DRINKING FOUNTAIN

(MADE IN CANADA)



The loss of a man through impure drinking water is a crime that "the front office" must bear.

An ugly statement, isn't it? But true, absolutely.

When a man comes to work in your factory he puts his health in your keeping.

Are you willing to take chances on such a trust?

Impure drinking conditions are responsible for more tragedies than any machine ever built.

Apply the "Safety First" Principles to your water supply: don't deny your men a clean, fresh drink of water.

Conserve their health and they will improve your profits: make yourself as worthy of the name of "employer."

Install the Gold Medal winner Puro in your plant, office and shop alike.

The only Sanitary Drinking Fountain that is safe, sanitary, simple, automatic in control and easily attached.

Let us tell you just what it will cost you to

Ironworks in Norway.—In Norway
scheme is being elaborated for the ere
tion of an ironworks with a minimu
annual output of 50,000 tons. It is to
built in the vicinity of water-pow
works and within 300 kilometres of Na
vik, the Norwegian port of shipment
Lapland iron ore. It is intended to i
stal a coke plant which is to be suppli
with foreign coal, as well as a by-pr
ducts recovery plant and steel work
with foundry and rolling mills. T
coal ,about 125,000 tons a year) is to
obtained from England. The capit
will be about $4,250,000.

Orders for Rails Are Unfilled.—De
pite the fact that the Dominion Gover
ment has permitted the Canadian ra
ways to import rails free of all duty e
cept the war tax the imports of ra
have been so far very small. The Go
ernment's action was taken as a mea
of relieving what was represented as
serious shortage of steel, due to the fa
that Canadian mills were so largely e
larged in the manufacture of war mu
tions. The railways wanted rails
order to move the crop, especially fro
some of the more recently settled di
tricts, and the Government authoriz
the importation of rails without the pa
ment of the regular duty. The railwa
placed large orders in the United Stat
but these orders have for the most pa
remained unfilled. One company whi
had on hand a quantity of second-ha
rails, released them for a military pu
pose, and has been unable to repla
them.

Will Make Paper from Wood Chips.-
Advices from Washington, D.C., sta
that as the result of studies which ha
been made at the Forest Products Lab
ratory on methods of handling wo
chips suitable for paper pulp, it is a
nounced that Wisconsin paper co
panies are now negotiating with the ra
roads for shipment to their factories
experimental trainloads of chips
Western woods adapted to paper ma
ing. Previous investigations by t
Forest Service have demonstrated th
good grades of paper can be made fro
a number of Western woods. The e
perts now estimate that some of the
woods, when cut into chips and dri
and baled, can be delivered to the mil
in Wisconsin at a very small advan
over the cost of chips made from loc
timber. In Wisconsin alone, it is state
there is an annual market for ov
300,000 cords of pulpwood.

Steel at New High Record.—Prices
steel in the United States, eight leadi
steel products being used for the pu
pose, averaged a new record high lev
last week. The estimate is $63.75
gross ton, which compares with $63
week ago and with $63.42 a fortnig
ago. The increase in the average w
brought about mainly by the advance

prices, and perhaps 1917 contracts from abroad will be met with $15 a ton more than was paid a few months ago. For instance, the Carbon Steel Co. of Pittsburg has received at rising prices an order from Italy for $3,000,000 in rounds and another order from the United States Government for $1,000,000 of deck plates for one of the battleships now building.

Catalogues

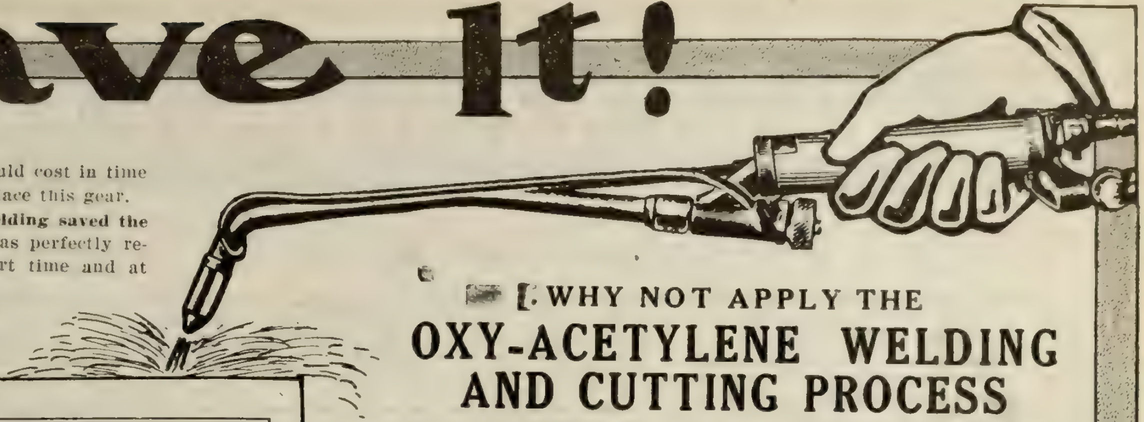
Engineers' Vise—A leaflet illustrating and describing the "Greyhound" engineers 'vise and a combined lathe, planing, shaping and fluting machine, made by Joseph Appleyard, Bradford, Yorks, England.

Turret Lathes. — The International Machine Tool Co., Indianapolis, Ind., have issued a bulletin illustrating and describing the "Libby" heavy duty lathe designed for use in railroad shops. The illustrations include several sketches showing typical samples of work done on this lathe and the time taken for the operation. The bulletin also contains a table giving a record of work done on the "Libby" lathe, being a copy of a railroad monthly cost sheet.

The Schoop Process Bulletin describing the "Schoop" metal spraying process, issued by the Metals Coating Company of Canada Ltd., Montreal. The bulletin first deals with the problem of corrosion, and the development and application of the "Schoop" process. Then follows matter relating to the construction of the spraying pistol, its mechanical details and method of operation all being described fully and accompanied by illustrations. The concluding pages illustrate and describe the "Gravitas" apparatus, devised for spraying zinc. A data sheet is included with the bulletin giving a detail cost of using the pistol with various metals.

Thos. W. Ward Ltd., Sheffield, England, have mailed us a copy of their "Albion" machinery catalogue which is issued monthly and contains a list of machinery in stock. The catalogue is arranged in two sections, the first section contains list of new and second hand machinery including machine tools of all kinds, electrical apparatus, steam, gas and oil engines, pumps, etc. The second section is devoted more particularly to second-hand boilers, tanks, tubing and rails, etc. Reference is made in the catalogue to other departments of the firm's business including scrap metals of all kinds, pig iron etc. It is stated that these materials are dealt with in large quantities and are purchased in a large number of markets.

Save It!



Think what it would cost in time and money to replace this gear. **Oxy-Acetylene Welding saved the day.** The gear was perfectly reclaimed in a short time and at low cost.

WHY NOT APPLY THE

OXY-ACETYLENE WELDING AND CUTTING PROCESS

for your REPAIRS and in your MANUFACTURE?

It saves you money, delays and trouble. It brings you money. We manufacture Welding and Cutting Plants Portable and Stationary.
"CLAUDE" OXYGEN—made from liquid air. The most efficient absolutely sold in purest form—full measure —at low price.
We also supply **PURE DISSOLVED ACETYLENE.**
Put your name and address on this coupon and mail it to us. **Full particulars will be sent at once.**

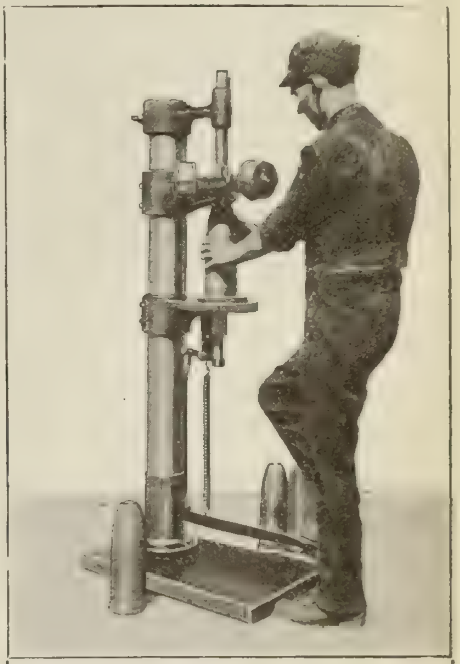
MONARCH
Milling Machine
(Made in Canada)

For Milling the three slots in the nose of

Mark 7 Shells

Adjustable to take any size shell from 4.5 to 9.2 inclusive.



ONE MOVEMENT of foot lever clamps the shell and feeds the three cutters in to the right depth.

CAPACITY ON 4.5—6 to 8 shells per minute. Actual cutting time is simply — "zip" and the three slots are finished.

THE MACHINE is complete with High Speed Cutters and drive pulleys which should run at about 550 revolutions per minute. It can be driven by three 2-inch belts, either from overhead counter or line shaft. The clamping device does not interfere with copper band, and altogether it will be found to be a very satisfactory tool—CONVENIENT and ACCURATE.

2 12″ x 24″ Modern Plain Grinders (nearly new).
1 14″ x 50″ Norton Plain Grinder (nearly new).
2 18″ - 30″ x 96″ Norton Gap Grinders (nearly new).
2 Landis Internal Grinders with No. 75 Heald Heads (nearly new).
1 No. 70 Heald Internal Grinder.
2 No. 60 Heald Cylinder Grinders (nearly new).
1 16″ x 66″ Landis Crank Shaft Grinder (18 months old).
2 14″ Swing Special Internal Grinders, capacity ½″ to 14″ dia. straight or taper.
1 New Yankee, style L, Drill Grinder (new).
1 No. 6M Besley Double Disc Grinder.
1 No. 300 Safety Emery Wheel Ring Wheel Grinder.

TURRET LATHES

58 Potter & Johnson No. 6-A Automatic (new).
8 Potter & Johnson No. 5-A Automatic (nearly new).
12 13″ Gisholt Semi-Automatic (12 mos. old).
20 21″ Gisholt Semi-Automatic (12 mos. old).
5 J & L two spindle (new).
1 J & L 2 x 24 with bar equipment, motor driven (fine condition).

MILLING MACHINES

1 No. 3 Garvin Universal (new).
1 No. 8 Becker Duplex (new).
1 No. 2 Rockford Hand Miller.
3 No. 0 Bristol Hand Millers.
1 Newton Duplex with 72″ table feed.
1 No. 3½ Becker Vertical with Dividing Head.
1 Small Duplex Miller.
1 No. 4 Hendey type Lincoln Miller (nearly new).

DRILLING MACHINES

1 8-spindle Bausch Multiple, 1″ capacity.
1 12″ Spindle Garden ½″ capacity.
6 Barnes 24″ 2-spindle All Gear Drive (new).
1 24″ Hoefer Sliding Head (new).
4 Henry & Wright No. 1 style K (nearly new).
12 Colburn Heavy Duty, size D-2 (new).
27 Colburn Heavy Duty, size D-4 (new).
1 26″ Rockford Sliding Head (fine condition).
3 4-spindle Dwight slate, 14″ swing, ¾″ capacity.
2 Peerless 20″ (new).
1 20″ Mechanics (new).
1 20″ Buffalo (new).
1 28″ Hamilton Sliding Head.
11 Burke No. 1 Bench (new).
1 25″ Kern Sliding Head with Tapping attachment.
362 Paragon High Speed Drills, 1¾″ x 14″ flute, 21″ over all (new).

RADIAL DRILLS

1 36″ Dreses, with quick return tapping attachment (fine condition).

ENGINE LATHES

38 16″ x 8′ Fairbanks-Morse (new).
1 18″ - 36″ x 8′ Fay & Scott Extension Gap (fine condition).
1 30″ x 12′ LeBlond.
1 12″ x 6′ American.
1 28″ x 14′ Fifield.
1 14″ x 4′ Blaisdell.
1 No. 4½ Barnes.
1 54″ x 21′ Detrick & Harvey.
1 26″ x 10′ Bradford.

MARKING MACHINES

2 Noble & Westbrook No. 1 (new).

PROFILERS

1 No. 3H Becker (new).

PLANERS

1 30″ x 30″ x 10′ Ohio with two heads (new).
1 44″ x 44″ x 12′ L W Pond with three heads.
1 40″ x 40″ x 12′ New Haven, with one or two heads.
1 36″ x 36″ x 12′ Sellers widened to 72″.

AUTOMATIC GEAR CUTTERS

1 No. 3 Brown & Sharpe 26″ (old machine).
1 36″ x 4″ Fellows Gear Shaper (fine condition).
1 18″ Schuchart & Schutte Tooth Rounder (nearly new).

CUTTING OFF MACHINES

1 4″ Hurlbut-Rogers Cone Drive (fine condition).
18 Newton No. 500 Gold Saw Machines with 20″ inserted tooth blades (new).

BELT LACING MACHINES

1 12″ Jackson (new).

KEY SEATERS

1 No. 1 Catlin (new).

SCREW MACHINES

1 No. 3 Stecher (new).
1 1″ x 8″ Pierce (new).
3 No. 2 Southworth (nearly new).
4 No. 2 Warner & Swasey, with power feed turret (nearly new).
4 No. 54 1⅝″ capacity National-Acme (used two years).
1 No. 4 B. & O. power feed turret, friction back gears.
1 No. 4½ B. & O., power feed turret, friction back gears.
1 2″ x 24″ Jones & Lamson Motor Driven (fine condition).
1 No. 6 Warner & Swasey 2¼″ capacity back geared but no power feed to turret (nearly new).

BROACHING MACHINES

1 No. 3 La Pointe (nearly new).

BOLT CUTTERS

1 2″ Landis Double Head (nearly new).

BORING AND TURNING MACHINES

1 4′ Bickford Boring & Turning Mill (nearly new).
1 20″ swing 4-Spindle Moline Vertical Boring Machine with 18″ x 36″ table.

BULLDOZERS

1 No. 4 Williams White (old).
1 No. 1 Williams White.

FILING AND SAWING MACHINES

1 Large Filing and Sawing Machine with 12″ stroke.

PUNCHES AND SHEARS

1 No. 3 Walsh Punch Press.
1 Moser 1½″ stroke Punch Press with Automatic Feed.
1 No. 17 Williams White Double End 8″ throat capacity ¼″ x ¼″.
1 27½″ throat lever punch ½″ capacity 1¼″ stroke.
1 Thompson Bevel Shear ½″ capacity.

PIPE MACHINES

1 6″ Saunders.

SHAPERS

1 14″ Hendey Geared Friction.
1 20″ Hendey Geared Friction.

TAPPING MACHINES

1 Garvin No. 1 Automatic (new).
4 Geometric High Speed Tapping Devices, style N (new).
4 Murchey 2″ collapsible taps (new).

THREAD ROLLING MACHINES

1 Waterbury Farrell ⅜″ capacity (nearly new).

THREADING MACHINES

5 Special Threading Machines for threading 3″ steel shells (nearly new).

SPOT WELDERS

1 No. 3 Toledo Type 14-A 220 volts 60 cycles (nearly new).

MACLEAN'S

for NOVEMBER

WANTED—A NATIONAL ANTHEM. Perhaps you yourself have felt in these times of intense patriotism Canada's lack of a real National Anthem; and, if so, Arthur Stringer's magnificent presentation of Canada's need in the November MacLean's will make you say "Amen and Amen." : : : The problem of the returned Soldier—a phase of it—is the subject of a special article which has the sanction and approval of Sir James Lougheed, President of the Military Hospitals Commission; a contribution of genuine interest to all business men : : : Business men will be glad to learn that the fine monthly Business Outlook article is to be added to by a department headed "Information on Investments" : : : Another excellent and timely contribution is "Putting the Crop Across" — how Canada markets her wheat.

H. F. GADSBY writes on "Conserving the Conservatives"—a political article that both Liberals and Conservatives will find good reading : : : Peter McArthur, farmer-author, begins a series of stories in the November Number with "The Witch of Atlas"—extremely good : : : Robert W. Service has another "At the Front" poem—"Fleurette," strong yet tender : : : H. M. Tandy, a Canadian writer of fine ability, has a story, "Straw-Stack Strategy"—fine! : : : Serial stories by Arthur Stringer and Arthur E. McFarlane.

For Rapid Production and Accurate Work

USE THE

"BRIGGS"

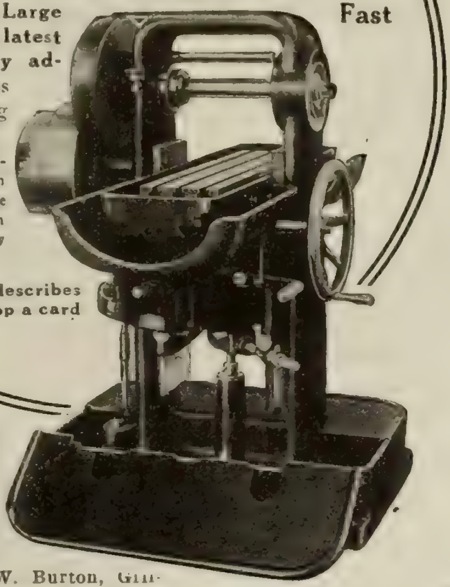
The Briggs Miller handles work no other machine of its size can touch. It is a manufacturing machine. On account of its rigid construction it will produce accurate work when running at a high rate of speed and feed.

The Base Tank and Large Gear Pump is the latest addition to its many advantages. Tank holds 20 gallons of cutting lubricant.

Fast

Pump never requires priming and will deliver ten gallons per minute to the cutters, keeping them cool when run at very high speed.

Our booklet describes fully. Drop a card for it.



Gooley & Edlund

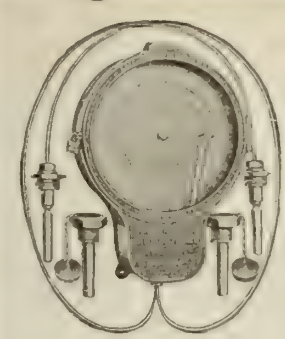
H&M Thermometers



Temperature Difference

of the entering and leaving feed water in heaters or economizers; the outgoing and incoming brine; the condenser intake and discharge; the steam or hot water heating system supply and returns or wherever heat transfer between two mediums is to be measured is most accurately and conveniently obtained by means of

H&M *Tycos*
Bi-Record Recording Thermometers

They trace two distinct records of the temperature changes and the time at which they occurred upon a calibrated rotating chart.

Consider the valuable information given by the instant comparison of the readings. Let us send you full details.

We are manufacturers of H&M Type Angle and Straight Stem Thermometers, Automatic Temperature and Pressure Regulators, Mercury Vacuum and Absolute Pressure Gauges, Engraved Stem Thermometers, Hydrometers, Hygrometers, Thermo-Electric and Radiation Pyrometers.

To Investors

THOSE WHO, FROM TIME TO TIME, HAVE FUNDS REQUIRING INVESTMENT, MAY PURCHASE AT PAR

DOMINION OF CANADA DEBENTURE STOCK

IN SUMS OF $500 OR ANY MULTIPLE THEREOF.

Principal repayable 1st October, 1919.

Interest payable half-yearly, 1st April and 1st October by cheque (free of exchange at any chartered Bank in Canada) at the rate of five per cent per annum from the date of purchase.

Holders of this stock will have the privilege of surrendering at par and accrued interest, as the equivalent of cash, in payment of any allotment made under any future war loan issue in Canada other than an issue of Treasury Bills or other like short date security.

Proceeds of this stock are for war purposes only.

A commission of one-quarter of one per cent will be allowed to recognized bond and stock brokers on allotments made in respect of applications for this stock which bear their stamp.

For application forms apply to the Deputy Minister of Finance, Ottawa.

DEPARTMENT OF FINANCE, OTTAWA,
OCTOBER 7th, 1916.

"DIAMO-CARBO"

You can make your dull or coated grinding wheels like new in efficiency by dressing them with

DESMOND-STEPHAN GRINDING WHEEL DRESSERS

and you will eliminate delayed production and lost time, due to the loss of their cutting properties.

Insist upon having your dealer supply you with one of our tools for trial. If he cannot, write us, and we will send any of them on approval.

The Canadian Desmond-Stephan Mfg. Company
HAMILTON, ONTARIO

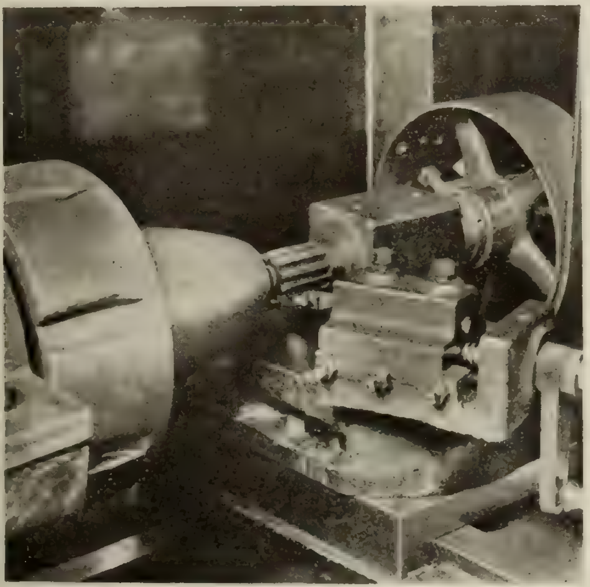
Our **"Diamo-Carbo"** Dressers are the economical **substitute for the Black Diamond Dressers. They** are so low priced that each grinding stand may be provided with its own dresser.

Our **"Sherman-Huntington"** Dressers are for use on large and coarse wheels upon which the Diamond cannot be used. It is the most satisfactory Dresser ever designed.

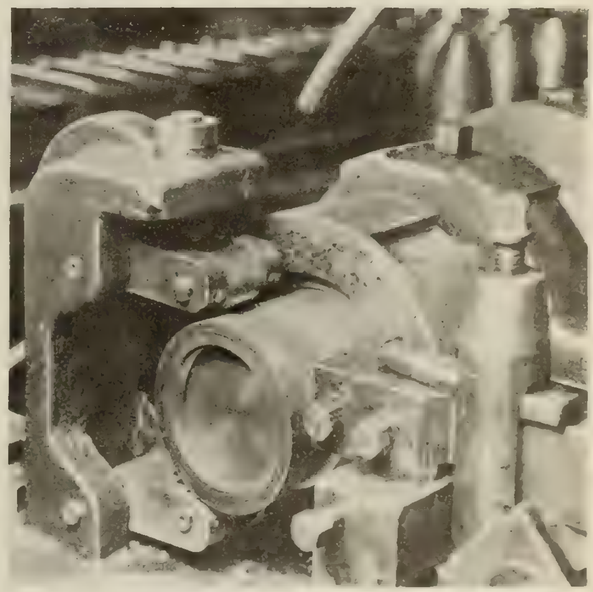
"SHERMAN-HUNTINGTON"

Alfred Herbert, Ltd., Coventry, Agents for Great Britain.

SPECIAL TOOLS AND GAUGES



The only correct time to perform the seating operation is to do it in the same fixture with the milling operation This fixture will fit any engine lathes, and costs only $120.00, including milling, cutter and seating tool. The angle of seating can never vary.



Most of the British Shells may now be knurled. This fixture is quick in operation and most accurate. The cost is only $100.00, and it can be used as an attachment to almost any lathe.

We have all gauges for both Mark V and Mark VII Shells, consisting of plug, length, outside diameter, form, thread and seating gauges.

Our Nosing Die Outfit is the best for the Mark VII shell. Leading manufacturers, such as P. L. Robertson Co., Milton; Wilford & Co., Lindsay; Manitoba Engines, Ltd., Brandon; Canadian Westinghouse, Hamilton; Vancouver Engineering Works; Vulcan Iron Works; Otis Fenson Elevator, etc., are using our dies.

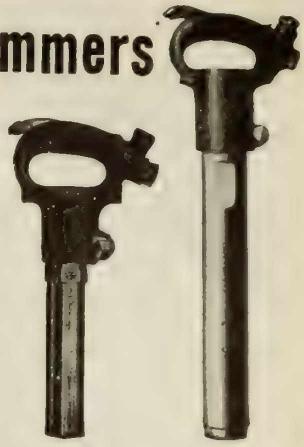
Cleveland Riveting and Chipping Hammers



Fitted with either Inside or Outside Throttle Lever as preferred. They are made in several different sizes and weights for all classes of work.
The Riveting Hammers have a range in rivets from ¼ inch to 1½ inches.

CLEVELAND CORNER DRILL For Close Quarter Drilling

The Body of the Cleveland Corner Drill is in one piece with cylinders and valve chambers cast integral which insures absolute alignment of working parts.

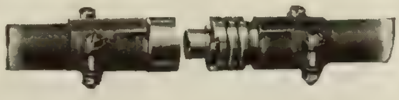
The Driving Crank is mounted upon Annular Ball Bearings which reduce friction to a minimum. Made in two sizes, Nos. 38 and 49, with Nos. 3 and 4 Morse Taper Sockets.

Either size machine will drill or ream within 1⅛ inch of side wall or corner.

IN STOCK:—Sand Rammers, Bench and Floor, Portable Emery Grinders, Air Drills, etc.

BOWES AUTOMATIC AIR HOSE COUPLINGS

Over 1,000,000 in general use



¶ They are instantly connected or disconnected.

¶ They are absolutely tight under all pressures.

¶ They are interchangeable in all sizes commonly used.

¶ They quickly pay for themselves by stopping costly leaks.

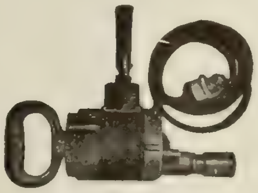
U. S. Electric Drills and Grinders

Save Time, Labor and Money

They can be attached to any lamp socket.

For drilling in metal they are superior to any other kind of portable drill. Cost 50% less to run than air drills.



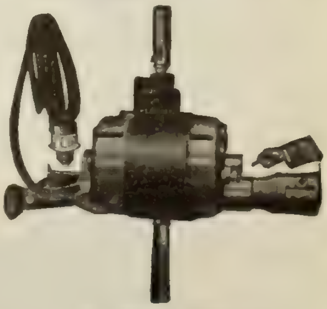
3 SIZES

3-16 inch,	W.G.T.	6 lbs.
¼ inch,	W.G.T.	9 lbs.
⅜ inch,	W.G.T.	12 lbs.

All motors wound for 110 or 220 volts.

Direct or alternating current.

Try a few of our Electric Drills and Grinders and you'll send us an order for more. Our guarantee protects you.



½ inch—2 SPEED.
Speed, 400-750 R.P.M.

J. H. WILLIAMS & CO.
BROOKLYN N.Y. BUFFALO U.S.A.

A QUALITY REPUTATION SPONSORED

Williams' "AGRIPPA" Tool Holders

"THE HOLDERS THAT HOLD"

THE YOUNGEST "GRAND PRIZE" HOLDERS

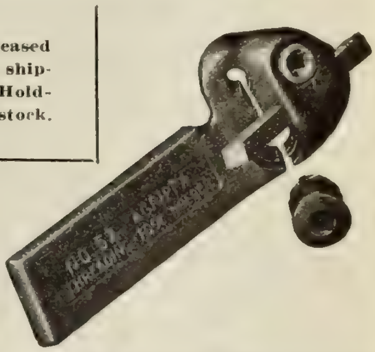
They were christened "Superior Character" by their mechanical examiners of the P.P.I.E.

Foresight, inspection and perpetual vigilance are necessary to maintain a reputation for tool sufficiency. Every test must be anticipated, every abuse prevented, every operation foreseen!

"AGRIPPA" Tool Holders have this fundamental advantage. J. H. Williams & Co. knew every tool-holder weakness previously shown by use or abuse before they presented Williams "AGRIPPA" Tool Holders for permanent adoption by live mechanics.

No 32 AGRIPPA
...ING-TOOL HOLDER

Compelled by an increasing demand to concentration, increased equipment and perfected routine, we now offer immediate shipment on nearly every size and variety of "AGRIPPA" Tool Holders. Wire us your order if your dealer can't supply you from stock.



J. H. WILLIAMS & CO.
45 RICHARDS STREET BROOKLYN, N.Y. CITY
THE WRENCH PEOPLE

A Wonderful Combination in Riveting

Speed—

One rivet per second.

Uniformity—

Each rivet headed with same degree of tightness or looseness as desired.

Finish—

Perfectly formed rivet heads, highly polished surface. No hammer or tool marks shown.

Grant Noiseless Rivet Spinning Machines are the only machines built that will accomplish the above.

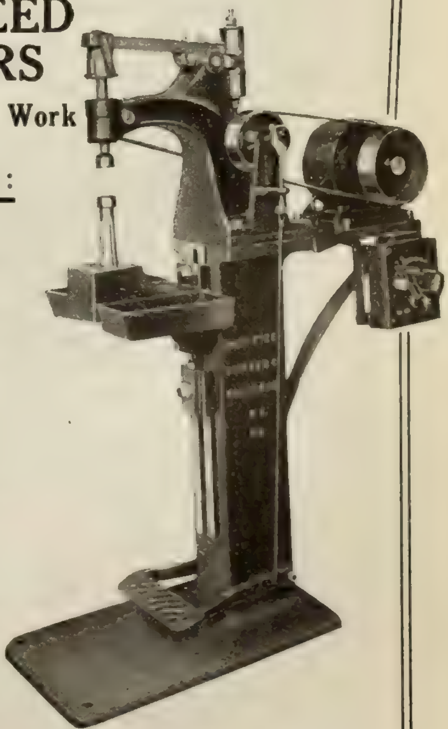
Catalog ?

The Grant Mfg. & Machine Co.

Holland Ave.
Bridgeport, Conn.

HIGH SPEED HAMMERS

For High Speed Work



FEATURES:

Economy in floor space, elimination of weight and a guaranteed saving of from 15% to 20% on any class of work. The life of the machine is practically indefinite as phosphor bronze bushings are used throughout.

No riveting too intricate for us; no riveting which our machine cannot accomplish.

Send for our **High Speed Hammer Book.**

CANADIAN MACHINERY

AND MANUFACTURING NEWS

A weekly newspaper devoted to the machinery and manufacturing interests.

Vol. XVI. TORONTO, NOVEMBER 9, 1916 No. 19

EDITORIAL CONTENTS

Machining the 4.5 in. Mark V. Howitzer Shell 487-491
General 491-492
Munition Workers' Woes—Glasgow Girl's Experience....Board of Trade Iron and Steel Industries Committee.
Production Methods and Devices 493-495
Machining a Blind Hole Having Thread Limitations....Handling Rig for Shell Cutting-off Machine .... Making the Shop Ladder Safe....A Sleeve-Holder Kink .... A Scale-Clip....Estimating Metal Temperatures by Colors....Tool Treatment in Railway Shops....Anti-Slip Ladder for Tile or Wood Floor.
Editorial Correspondence 496-498
Machines and the New Mechanic....Criticising Old Employees....Machinists' Instruction Course—IX.
Progress in New Equipment 499-501
Hydraulic Banding Equipment with Horizontal Triplex Pump....New Jolt Roll-Over Draw Machine....Steam Turbine-Driven Exhaust Fans....New Type Lock Nut .... Shell Nose Driving Machine.
General 501
The War and Merchant Shipping....Britain Becoming Independent of Foreign Steel ....Zinc Mine Development in Cape Breton....Some Demonstration.
Editorial 502
Labor Dilution in Metal-Working Plants Making Good....Post-War Problem Plans.
Industrial Notabilities 503
Henry Duff Reid.
Selected Market Quotations 504-506
The General Market Conditions and Tendencies 506-509
Montreal Letter....Toronto Letter....Lachine Canal During October....Shipping and War....Conservation of Pulp Wood....Trade of Newfoundland....Increased Value of Canadian Fisheries.
Industrial and Construction News 510-512

The "HENDEY" Lathe

The Service

Capacity and Convenience

of a Hendey Lathe will prove of vital importance to your tool room.

The **"Hendey"** is accurate in the highest degree and **suited for the efficient use of watch tool chucks, stop chucks, relieving attachments, etc.**

It has the best spindle construction in its taper journals, with annular bearings and automatic oiling rings, which make for accuracy of alignment.

It has **automatic stop** for carriage working in either direction. Has reverse for carriage, controlled from apron.

Wide range of threads and feeds through mounted gearing, with ability to make gear changes for additional threads and feeds without limit.

A card will get you full particulars. Why not mail it now?

C.M.C.

Engine Lathe with Quick-Change Gears

This lathe is built in two sizes—20-inch and 24-inch. It is equipped with the usual C.M.C. time and labor-saving features—quick-change gears, safety belt shifter, interlocked apron and convenient back gear shift lever—all placed within easy reach of the operator.

We can offer these machines for early delivery.

For convenience of the Trade, we have opened showrooms in Toronto at Brock Avenue Subway, where a full line of our machinery can be inspected.

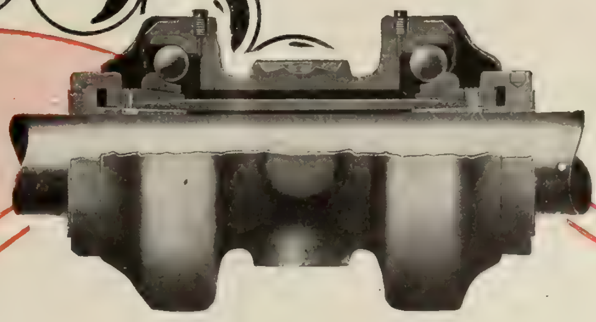
CANADIAN MACHINERY AND MANUFACTURING NEWS

A weekly newspaper devoted to the manufacturing interests, covering in a practical manner the mechanical, power, foundry and allied field. Published by The MacLean Publishing Company, Limited, Toronto, Montreal, Winnipeg and London, Eng.

Vol. XVI—No. 20 Publication Office: Toronto, November 16, 1916 Subscription Price $3.00 per Year



CHAPMAN

Double Ball-Bearings

Equip your line shafting with Chapman Double Ball-Bearings and you'll reduce friction loads 75%, making an average total saving of power 15% to 30%.

Oiling and attention are reduced to a minimum, and lubrication is only required but twice a year. Chapman Double Ball-Bearings fit any adjustable hanger, and the change can be made with very little delay to you.

ANOTHER THING—If you are in need of more power, Chapman Double Ball-Bearings will give you 15% to 30% more without adding to your power plant. **Used in over 2,000 Canadian Power Plants.**

Write for full particulars.

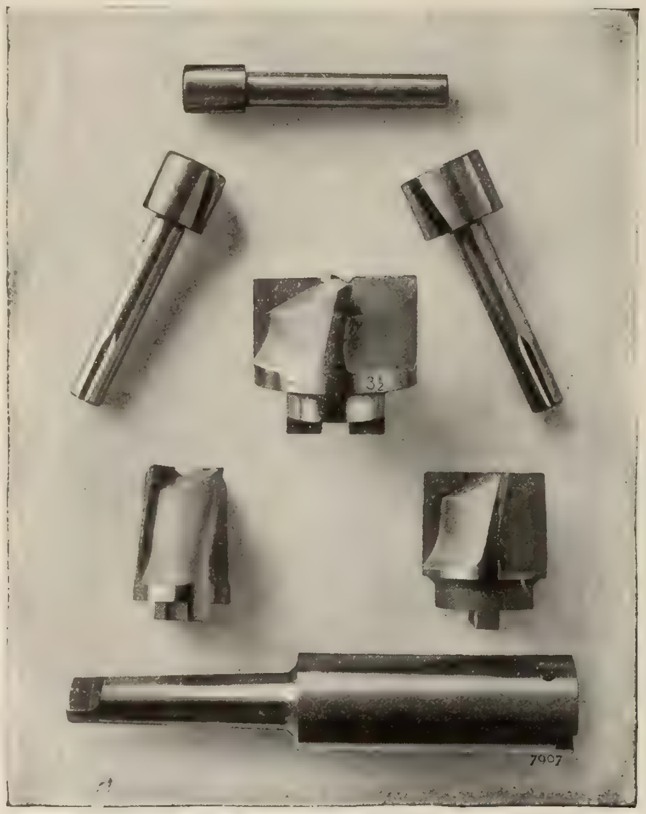
of 15% to 30%.

The Right Combination At Once



Holder, Cutter and Guide

For every counterboring job you can immediately make the right combination of holder, cutter and guide, if your tool room is equipped with

P. & W. Interchangeable Cutter Counterbores

Holders, Cutters and Guides furnished in wide range of sizes.

Holders

End of holder is milled to receive the driving lug of the cutter and there is also a hole and set screw to accommodate the shank of the guides.

Guides

Are of hardened tool steel. They are held in place by means of a set screw in the holder engaging a V-slot in the shank of the guide.

Cutters

Can be furnished of either carbon or high speed steel.

The shank of the guide passes through the hole of the cutter and the shoulder between the guide and its shank keeps the cutter in place. Cutters can be sharpened on the face and the guide is simply pushed further in the hole after grinding.

The Publisher's Page

TORONTO November 16, 1916

Going Up!

THE tendency nowadays is to go up. About the only thing that's going down is our common hand into our common pocket and that constantly, although perhaps reluctantly.

The bakers are busy explaining just why the price of bread has taken a sudden desire to break all records for standing high jump. The milk dealers, too, have most plausible reasons for skimming an extra two or three cents off a more or less long-suffering public.

The coal barons keep the people in hot water most of the time in well-founded anticipation of another rise in the price of fuel.

On every hand we feel and see or rightly suspect an upward move—at the grocer's, at the druggist's, at the shoe shop, at the dry goods store and at the haberdashery.

This, of course, is inevitable, even if it is uncomfortable. It is the result of over-demand and under-supply, and some juggling. We must expect it and most of us meet the situation with more or less cheerfulness.

The publisher has been hit as hard as any and a lot harder than some. The price of paper, ink, and other supplies entering into the production of a journal like CANADIAN MACHINERY has gone blissfully up and up, quite regardless of the protests or pleadings of the much be-squeezed publisher. Labor, too, has greatly increased in cost. Many printers have joined the colors and a trained printer cannot be replaced in a day, or for that matter in months or years.

CANADIAN MACHINERY, among other high-class Canadian papers, was recently compelled to increase its subscription price. On a percentage basis the increase was somewhat high, perhaps, but from a dollars and cents standpoint it really amounted to very little. At the new rate a copy of CANADIAN MACHINERY (averaging over 100 pages) cost the reader but five and three-quarter cents!

Nevertheless an increase is an increase, and the manner in which our subscribers received our announcement was very gratifying indeed, and we take this opportunity of thanking them for their very cheerful response.

It will be interesting to know that our circulation has steadily increased during the last two years, slowly on account of the demands of the war, but none the less surely, and rather more noticeably since our subscription price was advanced.

All luxuries are not useful and a necessary thing is generally recognized as no luxury at all. In this day of strict economy it is encouraging to note that the technical journal is regarded as a necessary thing and one to be desired at any price.

Quality Service

Courtesy in Business

* * *

Fittingly framed and hanging in the Offices of one of the most important Public Service Corporations on this North American Continent is the following

'Did you say Please and Thank you?'

Broad minded men direct the destiny of that Corporation, men who know that public or private enterprises to be lastingly successful must operate for the public good.

Quality and Service are the two important factors in our business life today, but Courtesy is the door through which they must enter.

We are large producers of Hamilton Pig Iron and our output of Open Hearth Steel Blooms and Billets, Iron and Steel Bars of all shapes and size runs into enormous tonnage.

The products of our mills include practically everything that can be manufactured from Iron and Steel and these we distribute to thousands of satisfied customers.

Our business is an extensive one and a successful one. The World is our market: but our prosperity and success in the future, as in the past, depend upon the continued confidence, co-operation and good-will of the people we serve.

The Steel Company of Canada, Limited

HAMILTON TORONTO MONTREAL WINNIPEG

Marvellous Cutting Tools—

are those made of

STELLITE

MADE IN CANADA
STELLITE

HIGH SPEED *TOOL METAL*

NOT A STEEL. CONTAINS NO IRON

It is an alloy so hard and tough that it will perform every operation at a higher speed than is possible with the best high-speed steel tool.

No metal too hard, no work too heavy.

Run steel tools till they're red hot and they burn up—they lose their temper.

Stellite Tools cut well when red hot because heat does not affect them. They have no temper.

It needs only a trial to convince you that speeds, cuts and heats that are disastrous to High-Speed Steel Tools are "Child's Play" for tools made of Stellite.

It will pay you to put it to the test right now.

BORING LATHE For 8", 9.2 and Larger Shells.

Marvellous for strength, accuracy and production.

A machine of the heavy, low-swing type, having specially designed carriage with auxiliary hand feed for internal profile.

Carries a 5½" steel bar with male taper, allowing for light design of cutter heads; three speed changes—automobile style. All speed gearing is steel, hardened, running in oil bath.

Regular equipment includes water attachment, pump, pan and piping, pot chuck, boring bar and steady rest — everything except cutter heads.

STEEL

for

SHRAPNEL

SHELLS

AND SHELL BLANKS

Only Company in Canada producing steel ingots by the "HARMET" Liquid Process.

REASONS WHY THESE INGOTS ARE SUPERIOR TO THE ORDINARY KIND:

1. Prevention of cracks, due to shrinkage; of internal stresses and resulting cracks and fissures.
2. Early cessation in the crystallization of the metal, and the production of fine crystallization of the metal, without cleavage planes.
3. Lessening of segregation, i.e., reduction of tendency to carbon and other impurities to concentrate in the central and upper parts of the ingot.
4. Prevention of "Pipes" or interior cavities, and thus preservation of absolute solidity in the ingot.
5. Improvement in physical properties.
6. Reduction in waste of ingot.

WE CAN SUPPLY FORGINGS OF ALL SHAPES AND SIZES MADE OF ORDINARY OR "HARMET" FLUID COMPRESSED OPEN-HEARTH STEEL ON THE SHORTEST NOTICE.

Speed—Accuracy

THE two most important factors in shell-making. The former is desirable, the latter absolutely necessary. Both are assured by the use of *Jenckes Single Purpose Lathes for Shell Work.*

Illustration shows the latest addition to this famous line—a Banding Lathe for 8" shells. Note the liberal proportions, the general appearance of sturdiness. They mean an extra measure of long and efficient service.

These machines are also manufactured for 18 pdr., 4.5", 5", 6", 8", 9.2", 12" and 14" shells; are tooled when required for the mm. sizes corresponding to Russian and French ammunition.

PRACTICALITY

AFTER fifteen years' study of the Miner's and Lumberman's wants, we know just what is and what is not required in tools for them.

Practicality has been the keynote of our organization. Experience has aided us in eliminating all unnecessary parts and in perfecting the design of our tools.

The use of best material and finest workmanship enable us to manufacture tools that are unexcelled.

We make a complete line.

Write us for prices.

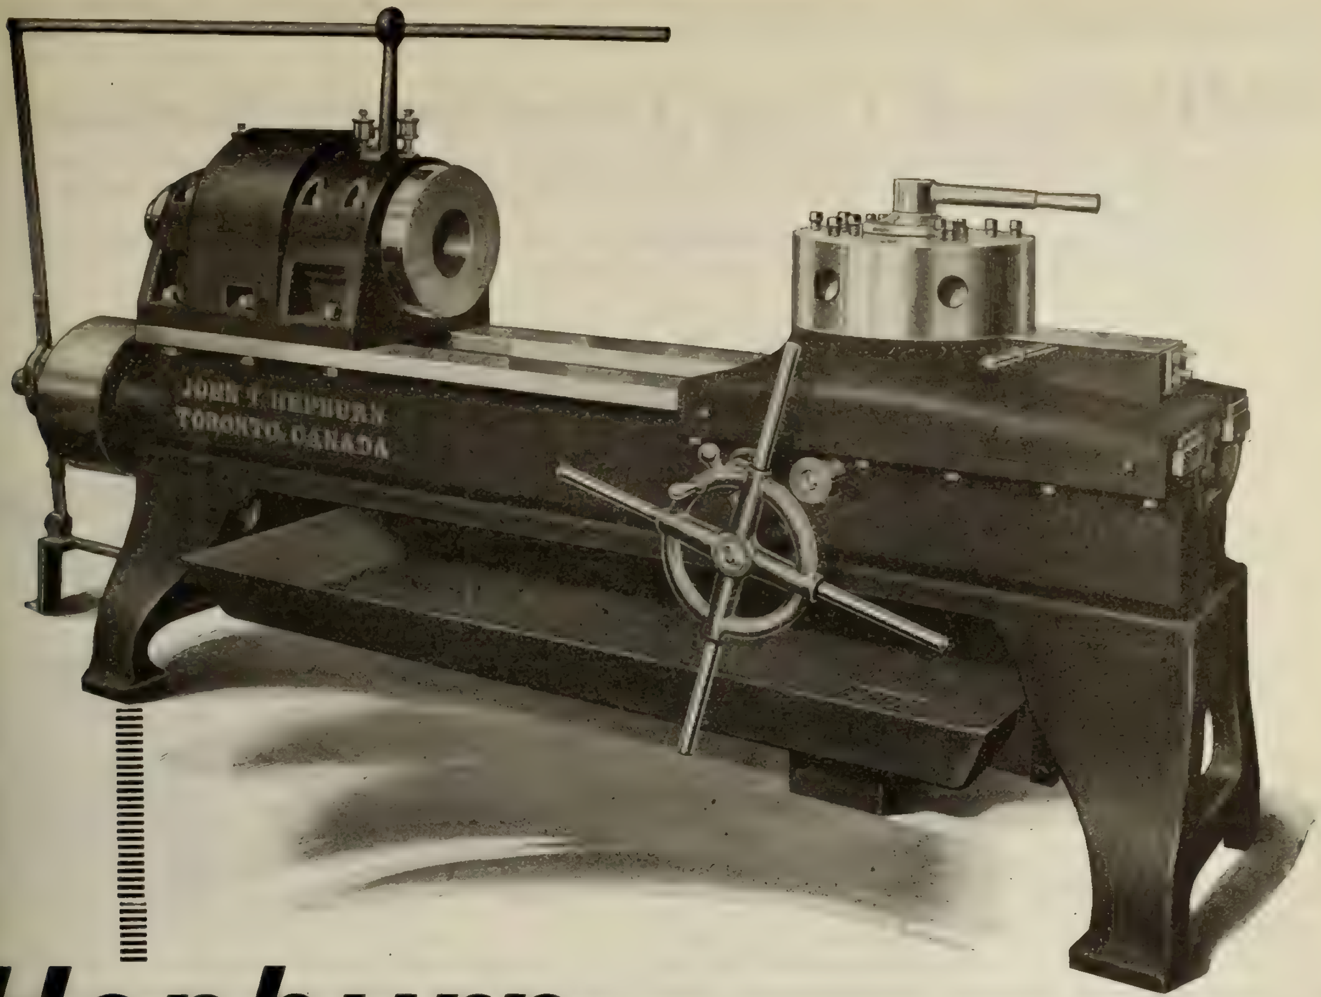
Wood or Steel, let Cummings make it.



Hepburn—

Heavy Duty Shell Lathes

When we made the first Hepburn Shell Lathe we had harder work selling it than we have selling Hepburn Lathes to-day. At first firms with munitions orders had not much or any experience with lathes for shell-making; and often cheap, light lathes, made to sell easily were purchased.

Later, however, the

Hepburn Lathe—

remarkable for Speed, Accuracy, Power Strength, Rigidity and Simplicity—came into its own; it was recognized to be worth its cost, for it actually saved its cost—and this very soon—in operation.

To-day the sturdy Hepburn Heavy-duty Shell Lathe is found in many factories holding its place of favor by reason of its uniformly perfect performance.

If you are in the market for a Lathe for shell-making ask us for specifications of the Lathe illustrated and other Lathes.

We make turning and turret lathes up to and including 9.2"

John T. Hepburn, Limited

18 to 60 Van Horne Street - Toronto, Canada

Millholland 1⅝ x 10 Turret Screw Machine

The combined result of two generations of engineering and mechanical experience. While, as a whole, it is no radical departure from established lines of the turret lathe, it has many original features, and with these features are combined well-known devices.

Safety, rigidity, convenience, production and durability are the ideas behind every step in their construction.

Your request will get you full details and specifications by early mail. Make it.

THREE REASONS

FOR

CELFOR

HIGH SPEED DRILLS

Specialization

We make just one line—High-Speed-Tools. For years our entire energy and all the facilities of our plant have been devoted to one line. As a result we have forged ahead and beyond in the manufacture of drills of quality, design and general efficiency, All are made by the forged and twisted process.

Delivery

An ample supply of steel makes possible our present production of drills, which greatly exceeds any record ever attained. We have in stock or in process of manufacture every tool of every size shown in our catalog. This means almost immediate delivery—from stock or very soon after your order is received.

Service

It is our constant aim to give you service when you buy and service after you receive the tools. Repeat orders are the secret of a successful business. They are only secured by the rendition of service and by quality of product. Our modern plant and efficient organization assure the former—a trial proves the latter.

There's Nothing Fancy About the "Hercules," but—

when it comes to turning—well, just watch it. When you have a tough job of straight or taper turning the very absence of frills and special attachments is a decided advantage. That's the idea behind a "Hercules"—a lathe that can handle work requiring sheer strength and power. Its extreme simplicity avoids confusion in operation and facilitates quick handling. When you realize that the majority of lathe work is plain turning, there are possibilities in the "Hercules" well worth considering. Early deliveries. Write us now.

Peerless HIGH SPEED
PEERLESS MACHINE CO. RACINE, WIS. U.S.A.

"100% Better, Faster and More Reliable

than any Sawing Machine we have ever used; we have had almost all makes of Sawing Machines manufactured."

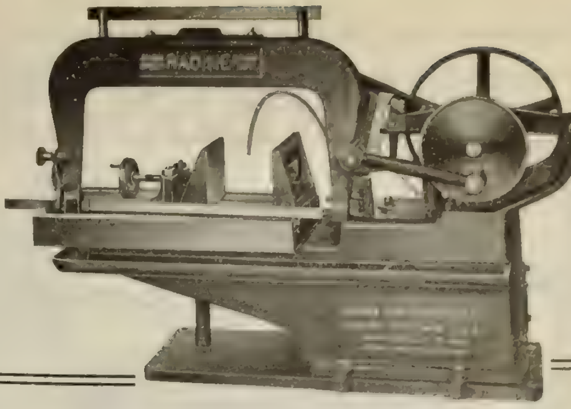
Just what a customer in Toledo, Ohio, reports after a thirty days' trial.

You don't have to take anybody's word for it, try it out under your own conditions. You are under no obligations if it fails—remember we also pay the freight both ways.

Not only 100% more production, but saves 100% floor space. These problems have handicapped many manufacturers for some time. They can now readily be solved by the Peerless High Speed Heavy Duty Metal Cutting Saw.

Write us for complete description and references. Some of these machines may be working in your vicinity.

Peerless Machine Co., 1607 Racine St., Racine, Wis.



ONE BLADE on this machine does what SIX of the same kind will do on any other

The Racine Metal Cutting Machines are exceedingly easy on the blade, BUT THEY FAIRLY EAT THE METAL.

One reason for the greater blade life is the **Positive** Automatic Lifting Device which lifts the blade clear of the work on the non-cutting return stroke.

Another reason is the Saw Frame Guide which positively prevents springing, and insures greater accuracy and there are many other reasons that we will be pleased to put before you.

The Racine is a metal cutting machine that will effect an immense economy in your plant.

Many Canadian plants are on our list of users. One Canadian Steel Company is using **120 Racine machines** and has saved $11,019.00—particulars of saving will be **sent on request.**

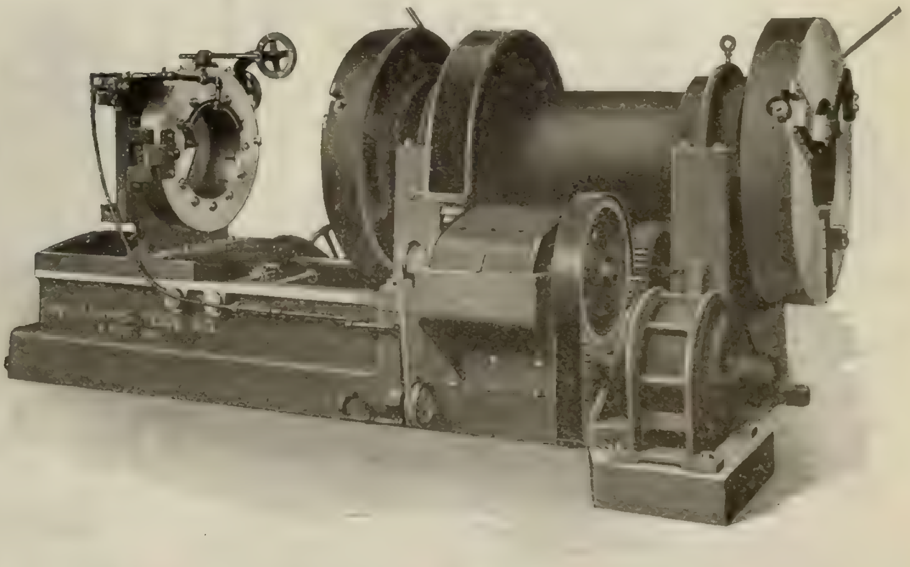
WILLIAMS PIPE MACHINES

Received Highest Award at Panama Exposition



The Following Letter Explains Why:

Williams Tool Co., Erie, Pa.: Rochester, N.Y., 12-3-14.

Gentlemen:—We are so pleased with our No. 3 Pipe Machine, and it is doing such splendid work for us at a minimum of expense that we are now considering the advisability of displacing two smaller machines for one of your No. 1½ or No. 2 motor drive.

The machines which we would displace, if we make a change, are belt drive, are (names of two of the oldest and best known machines on the market) equipped with nipple holders, extra dies, etc. Both of these machines are still in fairly good condition. On what basis could we make an exchange with you?

Yours very truly, SAMUEL SLOAN & CO.

Cut shows Chuck on nosing operation. This is one of over two hundred in this Canadian plant.

This chuck is *built on the duplicate part system. It is simple, effective and fool-proof.*

It grips the shell in a predetermined position. The jaws will not slip on the shell. It has shell interior and exterior adjustable stops.

A trial on one of your lathes will convince you that this is THE Chuck for shell work.

A Big Efficiency Unit in Your Shell Plant

A. J. LAVOIE'S

LOW PRESSURE

Compressed Air Chuck

This chuck can be applied to any make of lathe, without alteration to the machine, and will increase production from 25% to 75%. It grips and releases the shell while in motion—no need to stop your machine.

It is a single unit combination attached to the face plate of lathe, supported by an additional heavy duty bearing, thus making a heavy duty lathe out of a light machine. A small lever operates the chuck. Will operate with a pressure of 60 lbs. per sq. in.

MANUFACTURED BY

The Montreal General Tool Co.
673-5 Notre Dame Street, Maisonneuve, Montreal, P.Q.

Also manufacturers of shell tools, and special machine attachments of all kinds made to order.

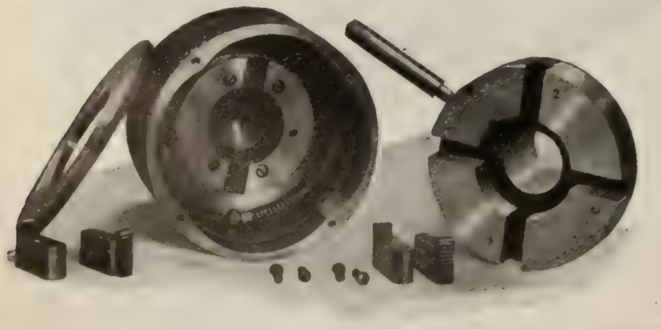
The "IDEAL" Die

for

Shrapnel

Quick, accurate work in threading Fuse Plugs for Shrapnel Shells is essential if you would make maximum profits. Your field is unlimited and your output governs your income. **Why not give the special type "C" Ideal Die a hard trial at this work and see if it will not boost production for you?**

Let the "IDEAL" cut the threads that bind you to low production. They will fit your machines. Circular on request.



"IDEAL" is a *different* die. The head revolves around a stationary cam thereby utilizing the belt power or cutting strain as opening power. Chasers are supported directly back of cutting strain, which will remove any tendency to bell out and cause taper threads.

27 William St., MONTREAL

Do Away With Friction Losses in Chucks

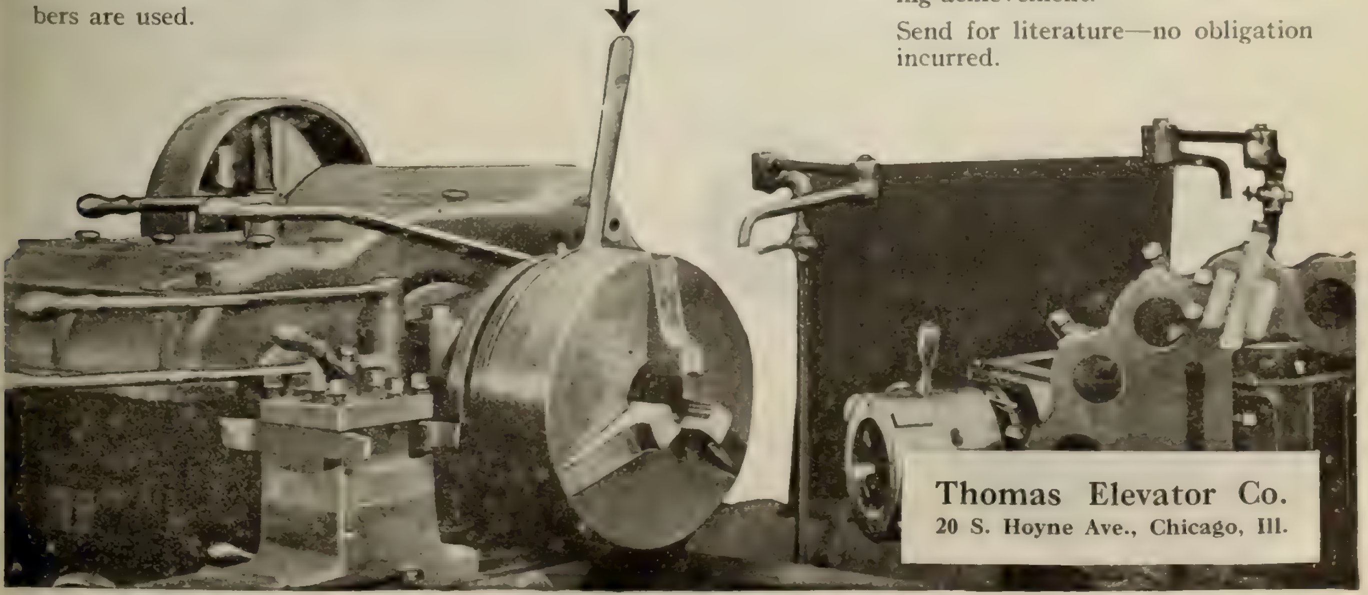
by using

Barker Wrenchless Chucks

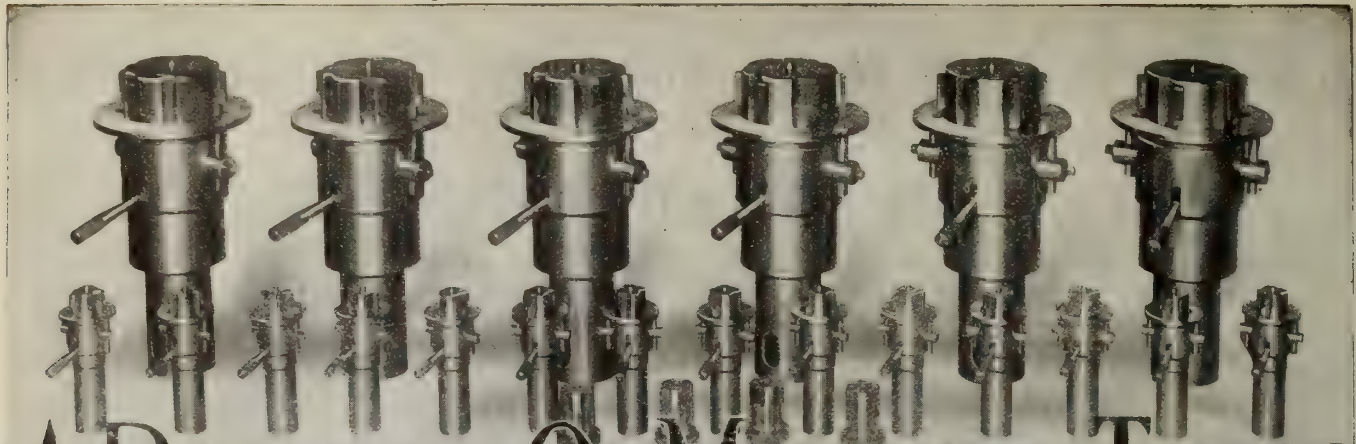
In transmitting the movement from the cam to the jaws of a Barker Wrenchless Chuck a leverage principle is involved which eliminates to a large extent the tremendous frictional loss incurred in chucks where scrolls or similar wedging members are used.

Operating mechanism combined with the chuck proper forms a single unit—no time lost in mounting—quick acting—opened and closed while the machine is in motion—these and many other vital points on this new but established departure in chucks may rightfully be considered a striking achievement.

Send for literature—no obligation incurred.



Thomas Elevator Co.
20 S. Hoyne Ave., Chicago, Ill.



A BATTERY OF MURCHEY TOOLS

FOR 9.2 SHELLS

This shipment went to a concern which is undoubtedly the biggest manufacturer of these Shells in the country. The lot includes—Six 6.68, 8-pitch taps for base. Fourteen 2-inch taps for nose. Four hand sizing taps with pilot.

Shell makers have found out that it pays to use Murchey Taps. Let us take this proposition up with you.

MURCHEY TOOLS

are famous for the way they stand up under hard service. They keep the work *in the Lathe,* where it belongs, and handle threading and tapping operations in half the time. You'll find Murchey Tools extremely simple and convenient to operate. They are designed to give results and to stand up while they are doing it. Get in touch with us. Send us your blueprints.

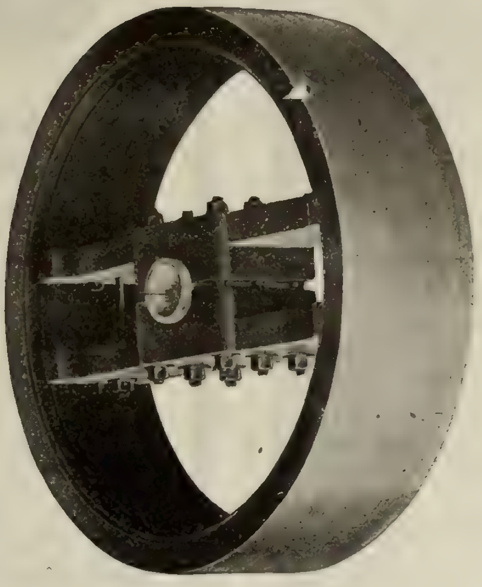
PULLEYS

No Keys

No Set Screws

In Perfect Balance



Lighter

Stronger

Better Belt Surface

The Dodge Standard Wood Split Pulley

The Wood Split Pulley is better than either cast iron split pulleys or steel split pulleys for the following reasons—

The wood pulley is lighter, stronger, better balanced, and provides a very much better belt surface. It costs 33 1-3% less money and provides 50% more returns in horse-power value. It may be run at very much higher speeds with no danger of bursting—also it may be had quicker and in a greater range of sizes.

It costs less to get—less to put on—and less to keep.

We make approximately 300 Dodge pulleys every day—everybody uses them.

There are more Dodge pulleys making ammunition than any other kind—you can get them quick.

Every pulley is thoroughly nailed. Every pulley is guaranteed for Double Belts.

We are Canada's greatest pulley makers.

If you have not our Books, write us.

DODGE MANUFACTURING COMPANY

Toronto - - Montreal

There's one to every 33rd man

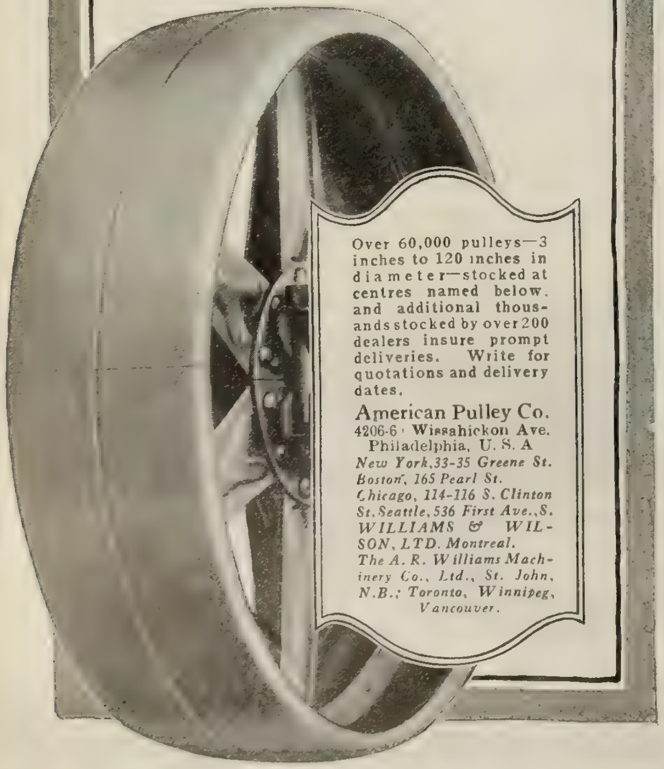
People do not always realize just what it means when we tell them that we have marketed about three million American Steel Split Pulleys.

The significance of these figures lies in the tremendously widespread use of this pulley.

When you compare that part of the population of the country *interested* in steel pulleys, with the total population, it looks like a mighty small factor—but when you consider that this small portion of all the people in the United States has bought so many "AMERICANS" that there is one to every 33rd person in the country, you will get some idea as to the magnitude of this business.

Definite points of merit, definite superiority in service, definite increase in value per dollar—these are some of the reasons why there is one "AMERICAN" Pulley to every 33rd man.

AMERICAN STEEL SPLIT PULLEY



Over 60,000 pulleys—3 inches to 120 inches in diameter—stocked at centres named below, and additional thousands stocked by over 200 dealers insure prompt deliveries. Write for quotations and delivery dates.

"FULFLO" MACHINE TOOL Lubricant PUMP

You can drive your machines faster

but your cutting tools won't stand it — the speed burns them up.

A cutting tool will stand up to higher speed and heavier feeds, providing it is kept cool.

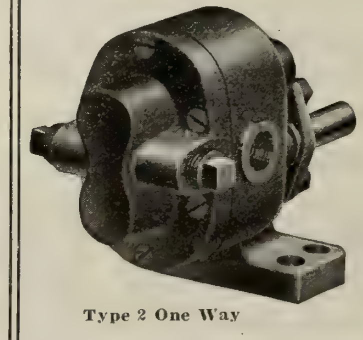
The "FULFLO" Machine Tool Lubricant Pump supplies a good "HEAVY" stream of compound sufficient to carry away all the heat.

No gears or other close-fitting parts to be affected by the grit, dirt, or small chips that are always present in the coolant. No clogging.

The only working part is the impellor. Since no check valve, reverse valve or any other kind of valve is present in the pump or pipe, other than the stop cock, the usual valve troubles are eliminated.

Easily attached to any machine. **Insist that the new machines you buy be equipped with the "FULFLO."**

The Cincinnati Lubricant Pump Co.
126 Opera Place Cincinnati, U.S.A.



Type 2 One Way

A Tip

Here's a tip for the progressive foreman or manager.

Roper Circulating Pumps will give you a simpler, cheaper and more effective way for delivering lubricant on machine tools. They eliminate separate relief valves and the piping that goes with them.

The pumps shown are for machines which run in one direction only. We also make a reversing pump for machines where tools operate with the spindle running in both directions.

Full particulars, sizes and prices are given in our bulletin. May we send you a copy?

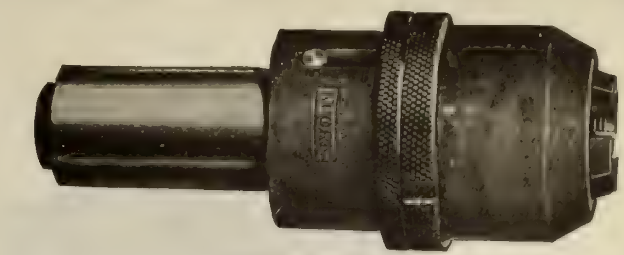
Acorn Die and Holder



The Die and Holder

A Most Compact and Efficient Die for *Any* Machine

SOME ADVANTAGES

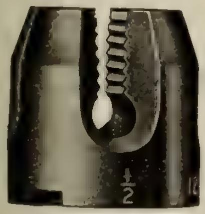
IDEAL ADJUSTMENT—All the lands have an equal bearing against the bevel of the cap, hence they will close in *equally*.

PERFECT SUPPORT to the cutting lands due to the ground surface in the cap. It cannot cut a taper thread.

INDEPENDENT LEAD—The holder has a float which permits the die to follow its own lead independent of any lag in travel of the machine.

DIES INTERCHANGEABLE—Instantly—right on the job without taking the holder from the machine and without resetting machine adjustment.

EASILY SHARPENED—Easier to sharpen than a Spring Die.



THE DIE

Our general catalog describes many other efficient tools for the machine shop. Send for it.

ground piston is a piece of art. Whether you are the very man whose machine turns out hundreds of finished ground pistons a day or not, you must realize that grinding of this class requires a wheel that is *right* in every respect. A large number of records have shown that a 36-J or K Crystolon wheel has uniformly produced the best results on piston as well as piston ring grinding.

Other than Crystolon wheels will grind pistons, but scores of manufacturers claim no other wheel will grind them with the same high rate of production, with as little dressing and produce as good a finish. Your problem may not be pistons, but we have records of wheel production on practically every kind of grinding which will aid us in recommending the right wheel for your work.

5—Blacksmith's Shop

In most plants a very important department, requiring as much care as any other department in the selection of equipment.

Modern Forges, Steam or Power Hammers, and Tools are required for the economical production of your forgings.

Our line of Blacksmith Shop supplies is complete. Every item is carefully selected to give the utmost service. Fairbanks-Morse equipment will give that ultimate economy which is measured by the original cost, plus upkeep.

The best of all is the fact that our prices are reasonable, and deliveries as prompt as can be secured, owing to present market conditions.

Let us quote on your requirements.

Principles and Apparatus Employed in Testing Limit Gauges*

By R. T. Glazebrook, C.B., F.R.S.**

Perhaps no finer evidence of the value of the National Physical Laboratory in England can be offered than the work of which this paper is at best an outline only. The enormous number of gauges required for munitions production was only possible as a result of training given to numerous skilled toolmakers at this institution. The value of properly made gauges will be still more appreciated in the future and increased demands on the Laboratory resources for testing precision apparatus by engineering firms are confidently predicted.

THE fundamental idea of limit gauging—that the dimensions of a piece of work should lie between certain definite values, and that the engineer should possess some means of measurement which would enable him readily to tell if this was the case—is probably quite old. Its importance, owing to the growth of repetition work and the demand for interchangeability, has increased greatly of late; during the past two years the growth has been enormous.

Engineering Standards Committee Work

The work of the Engineering Standards Committee in this, as in many other branches of engineering industry, has been of the utmost value, and it is to the reports of that committee we turn for much of the information on the subject. It is impossible to speak on this subject without reference to the two men whom we have recently lost whose labours did so much to promote the cause of standardisation. Sir H. F. Donaldson was chairman of the Committee on Gauges from its commencement. He threw himself into the work with all the energy of which he was capable; his tact and experience steered the committee over many shoals, his knowledge was of the greatest value, and his fairness and courtesy endeared him to all his colleagues. In all he did he was most ably supported by Mr. Leslie Robertson. Only the men who have been intimately acquainted with Mr. Robertson's work for the Standards Committee can realize the greatness of his loss and the difficulty of finding one to fill his place.

Report No. 27, dated June 1906, deals with British Standard Systems for Limit Gauges (Running Fits), and was the result of much careful inquiry and discussion. From it is taken the following definition:—

"Limit Gauges.—Gauges for ensuring that any given dimension is within the tolerance laid down for the class of work to be produced. In the case of cylindrical work these gauges may be either double male gauges, one end of which must enter, and the other end of which must not enter the hole to which it is applied, or they may be either two-ring or two-gap gauges, one of which must pass over, and one of which must not pass over the plug or male piece to which they are applied. The committee have in view three classes of limit gauges, viz.:—

"(a)—Standard Limit Gauges made in accordance with the recommendations contained in this report, and with the greatest possible accuracy, for depositing with the National Physical Laboratory, for purposes of reference.

"(b)—Reference Limit Gauges, being copies of the foregoing standard limit gauges for use by manufacturers and others for checking their own shop gauges. They should be verified, and their accuracy certified by the authority in whose custody the standard limit gauges are deposited.

"(c)—Shop Limit Gauges. — The gauges actually used in the shop and checked against the reference limit gauges."

To this list it is desirable to add "Check Gauges," i.e., gauges designed to check readily the dimensions of gauges in use either as reference gauges or as shop gauges. These are usually the inverse of the gauges they are employed to check, i.e., for a hole, the check gauge is a plug and vice versa.

I propose to say something about these various classes of gauges, their use, the permissible limits of accuracy, and the methods of measuring or otherwise determining their dimensions; but before proceeding to this three other terms in common use need definition. these are:—

Tolerance.—A difference in dimensions prescribed in order to tolerate unavoidable imperfections of workmanship.

Allowance.—A difference of dimensions prescribed in order to allow of various qualities of fit.

Clearance.—A difference in dimension or in the shape of the surface prescribed in order that two surfaces or parts of surfaces may be clear of one another.

In dealing with gauges we may subdivide them usefully into three groups:

1—Gauges for plain cylindrical work.
2—Screw gauges.
3.—Form and position gauges.

Introduction of Standardisation.

Years ago Sir Joseph Whitworth embarked on the standardisation of certain gauges for plain and screwed surfaces, and the use of Whitworth gauges has been of enormous value to engineering science, but these gauges are not, and had not at the time the committee began its work, been used as limit gauges in the true sense; consequently interchangeability was not secured. Sir Joseph aimed at standards which should be true dimensions, and he made no effort—at that time it did not appear necessary—to specify plus or minus limits for each class of work. Accordingly, at the outset the committee were faced with the necessity of inquiring what should be the limits on the work in order that interchangeability may be secured, and what gauges are required for this purpose.

Cylindrical Work and Gauges

In dealing with the work it is clear that the tolerances and allowances must depend on its nature and the class of fit aimed at; different allowances are necessary for running fits, push fits, force fits, etc. In the year 1906 the data available to determine these were small. Accordingly, arrangements were made by which Mr. Attwell of the National Physical Laboratory visited the workshops of many of the leading manufacturers of the country, and, by their kindness, carried out the accurate measurement of plain cylindrical shafts and holes from 2 to 12 inches in diameter. The results are contained in the tables and plates of a long report (No. 25) dated July 1906. Certain firms—notably Messrs. Armstrong, Whitworth—had already adopted a system of limits for their own use, and information on these was also before the committee.

As a result, the committee were able to draw up a definite series of recommendations with regard to running fits, though before reaching a final decision another difficulty had to be faced. Are the dimensions of the shaft or of the hole to be made the basis of the work? With an inch shaft, for example, is the shaft to be made as nearly 1 inch as possible with only the necessary tolerance and the whole of the allowance, to secure the running fit to be made in the hole which is, therefore, of necessity larger than one inch by the amount of this allowance; or is the reverse course to be adopted? In the end the committee adopted the view that wherever possible the shaft should be the element more nearly approaching the true dimensions, and allowance be made on the whole according to the kind of fit required. The tolerances on the shaft are negative, so that it may never exceed its nominal dimensions. A minimum allowance, obtained by making the hole of larger than nominal size, is specified, and this cannot be encroached upon by either element; above this a positive tolerance is allowed on the hole. For example, in the case of a 5 in. shaft and hole of first-class work, the tolerance on the shaft is .002. Thus it must lie between 5.000 ins. and 4. 98. The allowance is also .002, so that the minimum diameter of the hole is 5.002 ins. On this there is a tolerance of .002 again, hence the hole may have a maximum diameter of 5.004 ins.

---

*Presented at the meeting of the British Association at Newcastle, September, 1916.

**Head of the National Physical Laboratory, Teddington.

Shaft Gauges

This system the commitee call the shaft basis; they note, however, that the system may be reversed, the hole being taken as basis, and the allowances applied to the shaft, the minimum diameter of the hole being its nominal size.

It will be noted that, with a view to reducing the number of gauges required, the scheme has been arranged so that the maximum diameter of the hole for first-class work is the minimum for second-class work, and so on. Assuming now agreement has been reached as to the allowances and tolerances on the work, what as to the gauges?

For a shaft we require two gauges — two rings or snap gauges as may be preferred — one corresponding to the maximum or high dimension, the other to the minimum or low dimension, and as perfect workmanship is impossible these gauges must be subject to tolerances; what is to be said as to the sign and amount of the tolerances? Here a distinction has to be noted. So long as the work is within the limits allowed, interchangeability is secured, and will pass inspection. In fairness, however, to the manufacturer, all work up to the limits should pass; the inspection gauges should not demand narrower limits than the production drawings. Accordingly the tolerances on a high inspection gauge must be positive, those on a low inspection gauge negative.

This is a point which the gauge maker should carefully attend to. He knows, may be, that the nominal size of a certain high gauge is 2.00 in. with a tolerance of 0.0005 in.; he should try then to make his gauge 2.00025 in. In many cases the attempt is made to produce the gauges as nearly as possible 2.000 in., and some are made a trifle too small; they are rejected necessarily; had their aim been to arrive at 2.00025 in., probably all would have got through when tested.

So far, then, we have found that for an inspection gauge the tolerance is positive on the high gauge, negative on the low, but in the workshop gauge, as will be seen, the reverse is the case. These are given out by the manufacturer to the workman to enable him to make work which will pass the inspector. Clearly then for safety he will arrange that the limits to which the man works are rather narrower than those to which the work will be inspected. A high gauge will be a trifle too small, a low gauge slightly too large; the tolerance on the high gauge is negative, that on the low gauge is positive.

As to the tolerances permissible, these depend on the class of work dealt with, and for inspection gauges amounts of the order of one-tenth of the tolerances on the work are not unusual. Thus, for the 5 in. shaft of first-class work already referred to, the high gauge would lie between 5.000 in. and 5.0002 in., the low gauge between 4.998 in. and 4.9978 in. These, of course, are close limits. For a workshop gauge the tolerances, as well as being of opposite sign, may wisely be large in amount; the result of this is to contract somewhat the limits within which the workman has to work, but to increase the chance that his work will pass. Moreover, the "Go" gauges wear, and a ring or a plug may easily in time become too large or too small respectively if when new they are very close to their nominal sizes.

In our original classification of gauges, reference gauges were mentioned. These clearly include both reference inspection gauges and reference shop gauges; they are retained for the purpose of standardizing the other gauges.

Cylindrical Gauges Measurement and Testing

We turn now to the measurement and testing of cylindrical gauges, For the purpose of merely testing a gauge to see if it is correct, two check gauges---a "Go" and a "Not-go"---may be used, and in some cases must be used. The difference between these will be equal to the tolerance on the gauge they are used to check and their own tolerances will be much smaller, but for cylindrical gauges in most cases check gauges are not necessary, and indeed are not desirable; the difficulties arising from inaccuracy of manufacture and wear are too serious. Besides, rejection by a check gauge gives no intimation of the error to the manufacturer, and thus it is unsatisfactory to him. Thus cylindrical plug gauges are preferably checked by some form of accurate micrometer or measuring machine. To describe such machines in detail would fill a paper by itself; it must suffice to mention one or two leading points.

Cylindrical Plug Testing Machines

The original Whitworth form depends on the use of a feeler, a bar which is passed down between the jaw of the machine and the gauge under test, and while high accuracy can be attained by practice the results are slow and depend on the skill of the observer. In another form, the plunger presses against a a spring, and tilts a delicate level. The micrometer is turned until the bubble is central, thus securing that the pressure applied to the gauge is always the same; the importance of this is very great. It has been found useful at the National Physical Laboratory to replace the level by a tilting mirror; the machine is in adjustment when a ray of light reflected from the mirror occupies a definite position of a suitably-placed scale.

There was submitted a photograph of a large machine, built to the laboratory design, by Messrs Armstrong Whitworth, in which this device is used It is employed to measure large cylindrical gauges, and was built for the measurement of the coils of some of the standard electrical apparatus.

Another photo submitted to the meeting was an instrument in regular use for testing smaller cylindrical gauges. A vertical plunger pressed downwards by a spring actuates a light lever moving over a scale; below is a horizontal platform with a slow vertical motion. A standard gauge of the required dimension is placed on the platform which is raised until the upper end of the gauge pressing on the plunger brings the lever to the centre of the scale; the standard is then removed, and its place taken by the gauge under test The difference between this and the standard is given by the position of the pointer on the scale. In another instrument of this class, the motion of a diaphragm raises or depresses a column of liquid in a fine tube.

All these methods demand the employment of accurate standards of a large variety of lengths. Such are afforded by the now well-known Johanssen gauges. By means of these, length gauges differing in length by one or more thousandths of an inch can be built up with an accuracy amply sufficient for checking gauges to under the one ten-thousandth, and most of the test work at the National Pysical Laboratory is now done by the aid of these gauges.

To discuss the problem how the Johanssen gauges are checked would carry us too far into detailed considera tion of such work, while how to make them is a secret many would wish to share with Mr. Johanssen.

The checking of ring gauges or of snap gauges is a more difficult problem. For many purposes check gauges are used—a "Go' and a "Not-go" plug the external diameters of which can be accurately measured, and indeed for small rings this is the only method. For larger gauges there are various forms of internal calipers available but these do not lend themselves readily to high accuracy. A method which has been found convenient at the laboratary is to build up a "Go" and "Not-go" internal diameter gauge, by means of a series of Johanssen gauges with two plain cylinders of known diameter, one at each end of the series. When once such a diameter gauge has been put together, the checking of a series of rings of the same diameter becomes a simple matter.

Screw Gauges

The problem of the standardization of screw limit gauges is a very difficult one; a screw surface is a complex form and to satisfy oneself that in all its dimensions it lies within certain limits involves much careful work. The following definitions are taken from the report of the Engineering Standards Committee on British Standard Systems for Limit Gauges for Screw Threads.

Effective Diameter.—The effective diameter of a screw having a single thread is the length of a line drawn through the axis and at right angles to it, measured between the points where the line cuts the slopes of the thread.

Core Diameter.—The core diameter is twice the minimum radius of a screw, measured at right angles to the axis.

Full Diameter.—The full diameter is twice the maximum radius of a screw, measured at right angles to the axis.

Crest.—The crest is the prominent part of the thread, whether of the male screw or of the female screw.

Root.—The root is the bottom of the groove of the thread whether of the male screw or of the female screw.

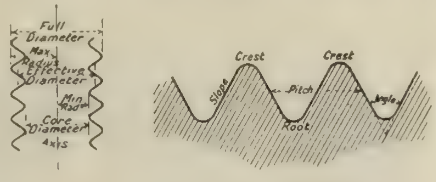
Slope of Thread.—The slope of thread is the straight part of the thread which connects the crests and roots.

Angle of Thread.—The angle of thread is the angle between the slopes, measured in the axial plane.

Pitch.—The pitch is the distance in inches measured along a line parallel to the axis of the screw between the point where it cuts any thread of the screw and the point at which it next meets the corresponding part of the same thread. The reciprocal of the pitch measures the number of turns per inch or millimetre, as the case may be. See Figs. 1 and 2.

In the Whitworth thread standardized by the committee there are seven elements, and error in any one of these may be sufficient to cause a gauge to reject work which ought to pass, or vice versa. These elements are as defined already:—Full (or major) diameter; Core (or minor) diameter; Effective (or pitch) diameter; Pitch; Angle; Form at Crest; Form at Root. Of these, the most important and the most difficult to control are the pitch and the effective diameter.

In the Whitworth thread the attempt is made to obtain contact over the whole surface of the screw. While possibly for some purposes this is desirable, it adds greatly to the difficulties of both construction and gauging, and there is much to be said for a system which allows definite clearances at crest and root. Four of the above seven elements—the two first and the two last—then become unimportant, and we are left to concentrate on the effective diameter, the pitch, and the angle of the thread. If the screw bears along its slopes it is doing its work satisfactorily, and in most cases the fact that there is clearance at crest and root is immaterial. Before proceeding further, it is important to notice that errors in pitch and effective diameter are closely connected.



FIGS. 1 AND 2.

Suppose the full and dotted outline, Fig. 3, to represent a ring and a plug screw of similar form, but of slightly different pitch. Let the maximum relative displacement of any two threads engaged be 2a. Then the extreme threads will be displaced axially by + a and — a respectively. A glance at the diagram shows that in this case the parts will not go together unless the axial displacement is accompanied by a radial displacement which, allowing for the angle of the thread, is about equal to 2a. This is doubled on the diameter, so that as a rough rule it may be taken that any error in pitch has to be compensated by an error of twice the amount in effective diameter.

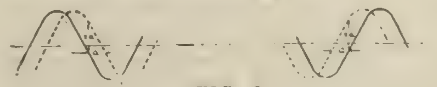


FIG. 3.

Thus we can compensate for an error p in pitch on a thread of which t in. are engaged by allowing a reduction of effective diameter of 2 p t in the plug, or an increase of the same amount in the ring. Some reductions in the full and core diameters are also required, but in consequence of the curves at crest and root these are small and need only rarely be taken into consideration. Reducing the effective diameter of a plug, or increasing that of a ring screw, has the effect of reducing the thickness of the corresponding thread at that point; the thread is made thin. Thus, in order to compensate pitch errors, makers have a tendency to make their screws thin; they claim an allowance on effective diameter which makes up for the error tolerated on pitch.

The Engineering Standards Committee, in their Report No. 38, stated that they have had two separate matters to decide upon:—

(1) To lay down tolerances on full, core, and effective diameters to cover the wear of tools and unavoidable imperfection of workmanship, and to prescribe minimum allowances in order that bolts and nuts may be assembled freely.

(2) To decide what errors in pitch could be permitted in ordinary practice, having regard to the allowances in effective diameter which they entail, and as a result they recommended a series of tolerances for the two threads considered—British Standard Whitworth and British Standard Fine.

The report also gives formulae for the tolerances on pitch and the allowances on effective diameter required to compensate them, and tables setting out the tolerances on the various elements.

Turning now to the question of providing limit gauges for such threads, we are met with many difficulties. The committee, after a discussion of these, summarized their recommendations thus:—

For Bolts

1.—"Go" and "Not Go" gauge of the "Taylor" type for pitch and effective diameter.

2.—"Go" and "Not Go" double gap gauge for full diameter.

3.—"Go" and "Not Go" double gap gauge for core diameter.

For Nuts

1.—"Go" Standard Bolt, correct in all particulars, and made to the minimum diameters allowable.

2.—"Not Go" single thread gauge for full diameter.

3.—"Not Go" single thread gauge for effective diameter.

4.—"Not Go" cylindrical gauge for core diameter.

Taylor Three Point Gauge

We shall see shortly what is meant by the "Taylor" type of gauge. For bolts, the three "Go" gauges recommended may be, and usually are, replaced by single "Go" ring gauge, a ring screw of correct form and dimensions. Such a gauge is difficult to construct and verify with accuracy; hence Mr. Taylor suggested for pitch and effective diameter a three-point gauge.

The three conical points, Fig. 4 accurately ground to an angle of 55° and truncated so as to clear the root of the thread, are described as follows:—Two are fixed on the lower jaw of the gauge, so that the distance between them is an exact number of threads representing twice the length of the screw contained in a standard nut of corresponding diameter. The third is fixed on the upper jaw midway between the two points on the lower jaw, and the three points are set to a standard male gauge having correct pitch and maximum effective diameter given in column 7 of table 1 or 3 of the report. Opposite the single point is fixed the flat face "a," which is adjusted so that the small cylinder "c" (of such a diameter that it will touch the thread about half way down its depth), will just enter the thread of a bolt made to the minimum effective diameter. Then in testing, if the bolt enters the gauge, and the "Not Go" cylinder refuses to enter the thread, the bolt is within the limits for pitch and effective diameter laid down in the tables, while any error in pitch which may be present will be duly compensated by a reduction in the effective diameter.

Using Ring Thread Gauges

With this gauge a "Go" and "Not go" ring gauge is used for the full diameter, and a "Go" and "Not go" snap gauge for the core diameter. With a complete ring gauge for the "Go" gauge, "Not go" gauges are required if the checking is to be complete for the full, core, and effective diameters. In practice it is generally considered sufficient to use a "Go" ring and a "Not go" full diameter gauge, though this opens the door to the employment of thin threads. It should be remarked here that a "Not go" screw ring is a useless and misleading gauge; it is difficult and costly to construct; it may tell you no doubt that the screw is wrong and ought to be rejected, but it affords no information as to what element in its form causes the rejection.

Up to the present no firm has undertaken the manufacture of the three-point pitch and effective diameter gauges, and they have not come into general use; they suffer also from the disadvantage that the wear is taken on the points, and even if these are properly hardened the life cannot be long.

It is easier to gauge a hole, for in this case the gauges are plugs. A complete plug gauge is required as a "Go" gauge, and, to be strict, three "Not go" gauges for the core, full and effective diameters. For the core the "Not go" gauge is a simple plain plug of appropriate size. For the full and effective diameters we use two screw gauges, each having a single turn of the thread; the first has a very thin deep thread, cut away on the slopes and at the root so as to bear only on its crest, while the second is cut away at the crest and root, and bears on the slopes; the diameters are in each case of appropriate size, and the screw is rejected if either gauge enters appreciably. If a "Not go" core diameter gauge only is used, holes with thin threads, in which the effective diameter, and probably the full diameters are too large, will be accepted.

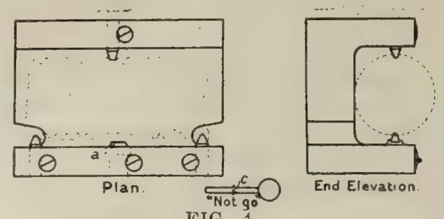

FIG. 4.

⁂

INDUSTRIAL CONSIDERATIONS AFTER THE WAR

IN the course of his presidential address to the members of the Manchester Association of Engineers recently, F. W. Reed, M.I. Mech. E., reviewed some of the economic problems of the engineering industry which will have to be faced at the conclusion of the war. He said we were well acquainted with the organization and productive capacity of the great neutral power of the New World; will it be less or more powerful in industrial competition with the great influx of gold to it from, in part, our unpreparedness? The complete industrial organization of the chief central enemy Power stands by the war revealed; will that organization cease to exist with peace, or will it be intensified into greater perfection and activity? We shall be secure only in the latter belief. Already we had warnings that these countries are making strenuous preparations for capturing foreign trade after the war—le us be prepared. In most of our establishments general work had been displaced by the making of machinery for the manufacture of munitions, whilst in others both the shops and machinery have had to be adapted to the making of shell and other war material.

Plant Equipment Readjustment

One of the problems which will come with peace will be the readjustment of these establishments to pre-war conditions; therefore, the Government and all concerned will do well to give the methods to be adopted their most earnest consideration. The men as they became released from military duties, and who so desire, must be reinstated in their former occupations. At the same time there will be a number who will not return to the trade; apart from casualties there will be some who will no longer desire to return to their former trade, and some others shall remain in the army for the time being; in any case, we shall be depleted of a number of skilled workers.

Mr. Reed said that there would be a demand upon our industries with the cessation of war there could be little doubt. The making up of leeway in civil requirements, the work of reparation and renewals until devastation had been obliterated, would still tax our energies to an extent little, if any, less than we were experiencing in the call for war material. There could be little doubt of our labor capacity for meeting that demand, providing it was organized on the best lines for economical production. The sudden change over of our manufacturing resources to civil work would be a task of considerable magnitude. A great quantity of additional machinery and new works which had been forced into existence by the war would be available, and could, no doubt, be largely utilized for civil work. Owing to the high-pressure conditions and the little opportunity to make good wear and tear of the past two years, considerable repairs would be necessary, so that a very liberal allowance for depreciation was imperative, not only to put our machinery in order, but to cover the cost of the unduly large number of machines which will have reached the stage beyond repair.

Restricted Output-Labor Dilution

Amongst the important problems that would arise after the war would be the questions of restriction of output and the dilution of labor, which even now are deserving of serious consideration. For the purposes of the war, trade unions had agreed with the Government to withdraw their rules bearing upon these vital questions on the understanding that they would be reinstated on the return of peace conditions. As a set-off to these conditions the employers were called upon to make considerable sacrifices in the way of handing over to the Government any extra profits above a certain limit which might be earned through their extra endeavors and running their works, in many cases continuously. If labor insisted that these rules shall be restored, the Government will have to comply; that was the present agreement, which cannot be departed from without the consent of organized labor. Whether it will be to their ultimate interest to insist on this restoration was a very important matter for their consideration, and both employers and labor must realize that the conditions of industry will be changed and both will have to meet the situation in a new spirit. Labor will do well to consider whether, after all, its own interests, and the interests of the nation had been served well in the past, or would be in the future, by their late policy.

PRODUCTION METHODS AND DEVICES

A Department for the Interchange and Distribution of Shop and Office Data
and Ideas Evolved from Actual Practical Application and Experience

EXPERIMENTAL WORK ON 4.5, MARK VII. SHELLS

By H. G. Evans.

ONE of the difficulties experienced in the manufacture of this shell was in getting the proper amount of stock on the inside of the nose below the undercut. Numerous experiments were conducted with this end in view, one of which consisted of driving a punch down through he nose after it was pressed in the regu-ir way. In conducting this test a number of shells were turned with a parallel diameter of 4 9-16 in. and having the outside of the nose beveled for a distance of $\frac{1}{2}$ in., being then nosed in as far as possible, but leaving just enough to barely clean up on the outside. Section A. in Fig. 1, shows the outline of wall obtained by this operation, while section B. shows a shell of the same dimensions after nosing and punching, from which it will be seen that the latter operation provides ample stock to form shoulder.

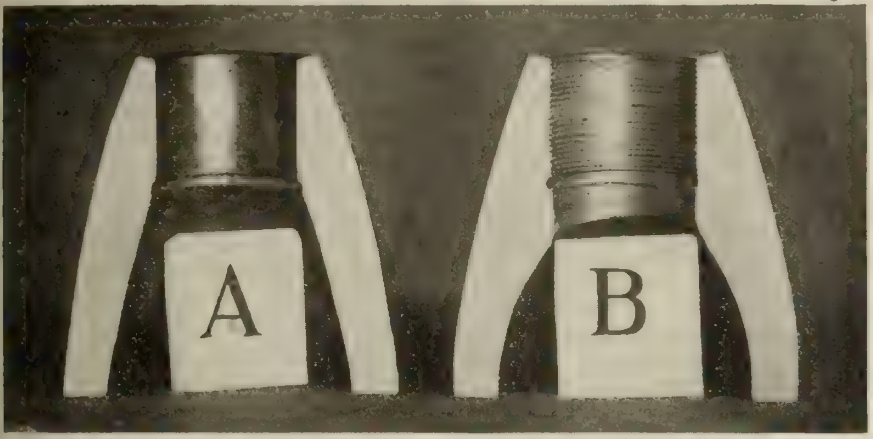

FIG. 1. SHOWING THE VARYING SECTIONS OF SHELL NOSE OBTAINED.

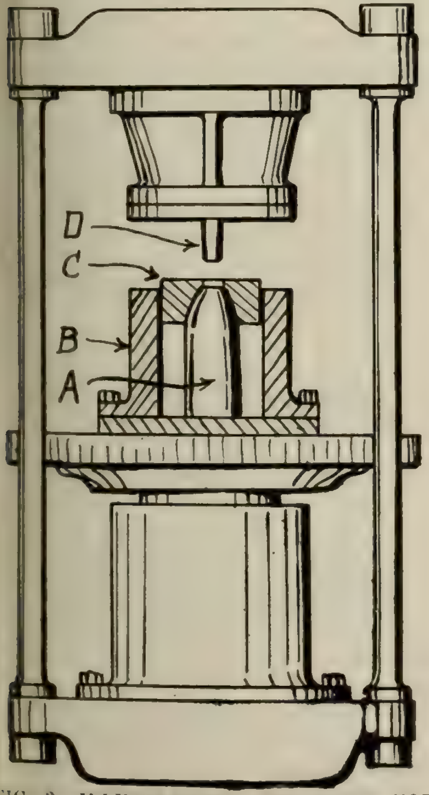

IG. 2. ILLUSTRATING APPARATUS FOR UPSETTING SHELL NOSE.

The temporary apparatus employed for the combined nosing and punching operation is shown in sketch, Fig. 2, a vertical four-column hydraulic press being employed. The shell A is placed inside of a cylindrical casting B, which guides the die block C, the hole in which is formed to fit shell so as to keep it from swelling when the punch D is forced in. In performing the operation a set of clamps were used to hold die block C down to platen so that weight of descending parts would strip the shell off the punch. Such a procedure was not satisfactory, as the punch remained fast in the shell.

To carry out this method of nosing successfully would require either a bulldozer or hydraulic press with pull back cylinder. The latter method would seem most desirable, a supplementary cylinder with pull back being mounted on top of the main press, so that after the shell was driven home into nosing die, the punch would be driven down through the hole in the die and into nose of shell, while the main cylinder holds shell firmly in place.

The punch used was $4\frac{3}{8}$ in. long, tapering from $1\frac{7}{8}$ in. to $1\frac{5}{8}$ in., but this amount of draw was not sufficient to release punch with the inadequate apparatus used for the experiments.

METHOD AND FIXTURES FOR MACHINING CENTERED TEE

By F. Scriber.

THE method of machining the centered tee illustrated by Fig. 1, is an example of simplicity and good judgment where the cost of machining must be held within moderate limits. This is realized when it is considered that although the method of handling is odd, only one special fixture is necessary and this is for the turret lathes, illustrated by Fig. 4.

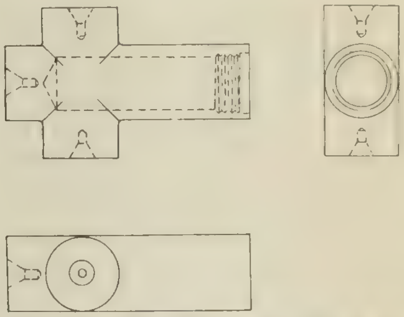

FIG. 1. CENTERED TEE WHICH IS TO BE MACHINED.

Referring to Fig. 1, the work which contains three centre holes and one drilled hole, is first handled by locating the centres of the various bosses by means of the standard centering device illustrated by Fig. 2. This device is a bench fixture, and is also used for centering many classes of work by placing one end of the work in the bell mouth of the base casting, when by letting the upper slid-

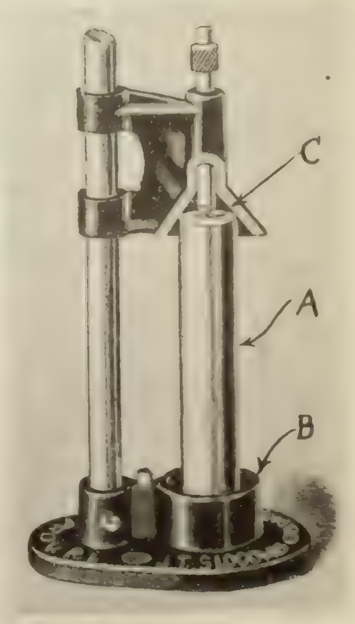

FIG. 2. STANDARD FIXTURE USED FOR CENTERING.

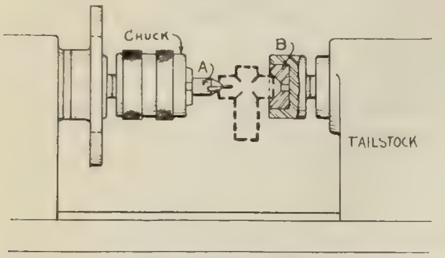

FIG. 3. ARRANGEMENT OF SPEED LATHE FOR CENTERING.

ing member drop over the work the centre may be prick-punched as shown in the illustration. After prick punching all the bosses in the centre the three short bosses are centered by means of an arrangement similar to that shown in Fig. 3. This consists of a speed lathe, the chuck of which holds a combination drill and a countersink, A, while the tailstock is equipped with a bell mouthed centre, B. In use the work is held as shown and the tailstock spindle is advanced in the usual manner to make the cut, while, by holding the work by hand to prevent it from turning, the centre is drilled. The final operation on this piece is a turret lathe job which consists of drilling the hole, etc., and by referring to Fig. 4, the method of tooling will be readily apparent. In holding the work for drilling full use is made of the centre holes in the short bosses, as the work is gripped between two pointed screws, A. and B., in a spindle nose fixture, C, using a spring pin D, to locate the work central, as the screws A and B are adjusted in or out until the spring pin, D, fills the hole, X, at all points; in this position the spring pin is clamped by the screw, E, thus holding the boss to be drilled in line with the spindle of the machine.

The screws, A and B, are now tightened to hold the work securely in place while the hole is spotted, using drill F in first turret hole. Following this, the in first turret hole. Following this, the G, and is counterbored, using cutter H, held in holder, J, in second turret hole, following which the hole is reamed using a floating reamer, K, in third turret hole, while the fourth turret hole contains a tap for cutting the thread. In connection with this illustration, it will be noticed the spindle nose fixture has a guard, L, which swings over and protects the operator from getting caught in the screws, thus making a safe and simple fixture of cheap design.

LITTLE KNOWN FACTS ABOUT GRINDING—FORM GRINDING

By Howard W. Dunbar.

IT IS not necessary that the face of the grinding wheel always be straight as it is possible by the use of special truing fixtures and devices to shape the face of the wheel in a manner which makes it possible to grind forms in various kinds of work.

In form grinding, as in form milling, it is essential that the shape be continuous and uniform. It is impossible, of course, to grind under-cuts or varying shapes in a given form. Not every shape can be ground, any more than can every round piece of work be finished by the grinding process. Sharp corners should be avoided, not because of the inability of the truing device to shape a sharp corner, but rather because the small particles of grain and bond of the wheel which go to form the corner will not stand up and grind long enough to maintain such a shape. This follows because there is so much work required of so few particles of wheel that naturally they wear out and break away very quickly.

Still another factor which must be considered in form grinding, is the varying depth of wheel face of the shape which is being ground. The wheel acts differently, of course, all along the form, depending on the distance that the cutting particles are from the centre of the wheel, since irregular shapes in the face of the wheel cause the wheel to vary in diameter all along the width of the form, and if this variation in these diameters amounts to enough to vary the peripheral speed of the wheel materially at various points in the form, the wheel acts differently, and a uniform finish or rate of production cannot be maintained.

The limitation in form grinding is therefore governed by three things: The capacity of the attachment in producing varying shapes, the physical possibility of the grinding wheel to maintain a given form, and the depth of the hills and valleys in the face of the wheel, caused by the form, which affect the pheripheral speed of the cutting particles.

Frequent Truing Necessary

The wheel must be trued frequently on form grinding to maintain the shape, especially where there are abrupt changes in the contour, such as sharp corners, small radii or deep cuts. Long sweeping curves or shapes which blend well into each other maintain their form more uniformly and for a greater length of time than do the more irregular shapes with sharp corners and angles. There are probably a great many machining operations now performed by other processes which could be readily accomplished by form grinding, effecting a saving in cost and producing a more accurate job with a finer degree of finish. The use of the grinding machine for this class of work is increasing as people come to realize the possibilities in shaping work which requires accurac and good finish.

Flat work ground on a surface grinding machine can be formed just as well as round work on a cylindrical grinding machine. The only difference in thes two methods of grinding is in the manner of handling the work. On the surface grinding machine the work is move under the wheel on a reciprocatin table; on the cylindrical grinding ma chine the table cannot be moved, an the wheel with the shape formed in i must be fed straight into the work.

One illustration of the usefulness o the formed wheel in producing shape parts is in the crowning of pulleys. Th crown can be made accurate within .00 in. on either diameter at the edges o the pulley, and the height of the crow be less than if turned.— *Grits & Grind*

THE ENGINEER AND HIS ADVERTISING—I.*

By Chas. B. Penwarden.

THE modern engineer is a philanthropist. I have come to that conclusion after many weary hours of wandering through the advertising pages of British engineering trade journals. Another discovery I have made is that the profession which is obviously one of the most punctilious and exact is the one profession which totally ignores its own teachings when dealing with the publicity for which it annually pays away a very large sum of money—hundreds of thousands of dollars.

Keeping One's Name Before Public

It is a common saying among men in certain businesses that advertising may be all right for the man next door or in the next street, or on the next floor, but so far as they are concerned they have done certain things for so many years and they see no sound reason for changing. They are well known, and it is but a matter of keeping their name well to the front. Some of them have this disease so bad that while they would scorn to be associated with the name of a pill in twenty feet letters upon a wall, yet they commit a far greater offence by having their name in three-inch letters in the trade papers, being presumably under the impression that all its readers are badly troubled with myopia.

I have said that the modern engineer is a philanthropist because I cannot understand, from an examination of his advertisements, how he can expect the money he pays for space to do very much else than keep his trade papers in a more or less flourishing condition. Sometimes, in conversation with engineers, I have been conscious of a fleeting impression that all this good money is spent more as a concession to a custom than for any other reason, but there happens to be a sufficient leavening of wide-seeing men who believe in getting full value from the space they buy, and so I am forced to the conclusion that the vast majority of engineers buy space but attach very little value to it—so small a value, in fact, that they think it scarcely worth bothering with.

What Investigation Shows

Careful calculation has shown that not one-half of one per cent. of the firms who use space in engineering papers have any definite idea of what to do with the space, and in the case of the minority it is plain to see the mark of the trained hand. It is interesting to pick out those advertisements which are calculated to result in increased business and to note the ingenuity displayed in working up the various points of value in selling, but the numbers of specimens of this high-class work are so very limited that it leaves one altogether puzzled to understand why large and reputedly go-ahead firms lag drearily in the backwaters of the modern publicity stream. They remind me of people who have hired a motor boat and have no idea how to start and attend to the engine.

There is another point about engineers' advertising—in fact, there are several, which I shall have to demolish before I can begin reconstruction—which always puzzles me, and that is the very prevalent idea that engineers are not as other men. Engineers themselves do not say this. It is just the impression conveyed by their manner and ideas where publicity is concerned. I have yet to learn that engineers eat, drink, sleep, marry or die in any way different to any other people, that their amusements are of any different character, that they talk or keep silent, go to church, chapel, or golf, in any way peculiar to themselves, or that they breathe faster or slower, walk backwards, or do anything in any way whatever different from the average human being. Yet many have solemnly told me that a specific thing might do for or appeal to any other business on earth except the engineering, and in so expressing their opinions manage to convey the impression that—thank God, engineers are not as other men!

This is not done in an offensive way; quite the contrary. In business I like dealing with engineers, as I always find them more courteous and considerate than men engaged in many other lines of which I have had experience, and I attribute the fact largely to the higher standard of education which is necessary for any degree of attainment to be reached in this particular profession. This fact makes it the more difficult to understand why engineers' advertising is worse than that of any other business. I have tried to find out why this should be so, and I have come to the conclusion that, generally speaking, the engineer of to-day, from an advertising standpoint, is from fifteen to twenty years behind the times. Anybody can prove this by comparing the advertisements which appeared twenty years ago with those which are now appearing. Many other businesses have gone ahead with the times, but the engineer has stood still—which is just the sort of thing one would imagine an engineer would not do.

Too Limited Advertising Appropriations

There is, however, in my opinion, a reason for this which has no connection with engineering at all, and it is that a great deal of the tremendous progress which has been made in advertising is due to professional advertising men who have made the business of advertising what it is to-day. While many industries have been benefited by this special work, the engineering profession has suffered on account of the limited appropriation which has been allotted. This limited appropriation is, in most cases, unavoidable because of the restricted field. From the advertising man's point of view it is easy to see that, working as he usually does upon a 10 per cent. basis, businesses and industries likely to need the spending of $100,000 a year upwards offer more attractions than those which scarcely ever rise above $10,000 or $15,000 a year. This means that there is less competition among the best men, and so the engineers' advertising is left, largely, to the mercies of a general utility man, helped occasionally by the manager or managing director and sometimes by the board of directors. The result is seen in the typographical and etymological horrors which are perpetuated in each succeeding issue of the trade papers.

Now, if an engineer were to ask me what I knew about engineering I should promptly answer "Nothing." Therefore, am I a dependable critic, not of engineering, but of the attempts of the engineers to sell their products.

If I asked an engineer what he knew about human nature, he might answer "Nothing," and he might answer—something else, but the fact would remain that he would be condemned either way—by his advertising.

Why Engineers Seek Publicity

If we analyse the reasons why engineers spend money in publicity we should probably arrive at the following conclusions, or some of them:—

1.—Because he believes in supporting his trade papers.

2.—Because others in the same line do it.

3.—Because he has been canvassed by various representatives, and does it in order to get a little peace.

4.—Because he wants the business.

As no good purpose is served by discussing the first three, we are reduced to No. 4.

We believe that the average engineer

---

*From Herbert's Monthly.

spends money in advertising because he wants more business.

On the one hand, we have the section which screams its message at us like a Cheap Jack at a fair, and on the other, we have the dignified person akin to the poor old lady reduced in circumstances who tried to make a living by selling fish, and who wrapped her wares up so that nobody should see them, and then whispered "Fish! Fish!" to herself in an agony of apprehension lest anyone should hear her. Both of these methods are the direct result of ignorance of the proper functions of advertising. The use of ink on paper is but a method for conveying a message to those who can be reached by no other means at so cheap a rate. Advertising should be salesmanship in print. When we realize that, we realize in a flash all the shortcomings of engineers' advertising. It is advertising inasmuch as its appearance suggests something to be sold, but it is not salesmanship because it does not sell—except by accident; and the reason that it does not sell is because it is not constructed to sell.

Effective Advertising

To be effective, an advertisement must possess the power to shift money from the pocket of one person to the pocket of another; and in order to accomplish this the advertising must talk; and before it can talk it must find something to talk about, and the place to find that something is in the goods.

Now, if two firms make an article exactly alike, both equally dependable, of similar workmanship and of identical design, who will sell the most? Obviously the firm whose selling organization is most effective. It may be done socially; it may be done by less worthy methods; the name may do it, and it may not; influence may help, and probably does; but these methods are not wrongfully described as archaic, because it will be proved eventually that the firm which talks the longer, more sensibly and clearly, explains more, finds and gives reasons for the preference being given to its goods, and persists, will in the long run, caeteris paribus, be the winner. This when the two articles are of equal merit. When one has an advantage there is all the more reason why that advantage should be pressed by right advertising methods.

There is another obsession prevailing amongst engineers which proves that they have not advanced along the high road of publicity to the same extent that they have advanced along other roads, and that is found in the prevailing tendency to compare American advertising methods with their own to the detriment of the latter. In this connection the following extract from *The Electrical Times* of June 22nd will be of distinct interest and value:—

"Englishmen are occupied with Germany and its preparations for crushing our trade after the war. That is a very proper occupation: we wish it every success. Germany will ultimately rally from the knock-out; her future must be watched; but it is remarkable that very little attention is being paid to America. At present the United States are satisfied with their profits, as they have reason to be, in all conscience; they are fabulous, but what is to happen when their industries grow hungry? Current engineering literature from America evokes our admiration. Here is the General Electric's domestic magazine, for instance, weighing 1 lb. and packed with such a wealth of technical information in its 567 pages as no one technical pournal in Britain could afford to produce.

"Wealth bubbles over; it oozes from every American pore. The latest *Electrical World* weighs well over 2 lbs. and costs 18 cents to post, but it was sent out to English station engineers. Let any reader take a glance at the plutocratic pages of such publications as these; let him note the lordly manner in which the American firm advertises in them; and then let him say whether beaten Germany, crouching for a spring at our throat, but ham-strung by financial disaster, is really the force which is destined to baulk our foreign enterprise of the next few years. We do not believe for one moment that our American cousins are out for anything but dollars, they have no ulterior object such as Germany had; they prefer to see us survive and prosper; but even as bedfellows their sheer mass of adipose tissue may leave us without any blanket and give us the worst cold we ever had in our lives."

American Advertising Methods Instructive

These are words which every engineer would do well to take to heart. The same arguments used against American publicity methods by engineers to-day were used by most other advertisers ten or fifteen years ago. That a good deal can be learned by a study of American engineering advertising is easily proved by a perusal of American engineering journals. There will be found very little clap-trap or vague assertions in these journals to-day; not so much, in fact, as is to be seen in some British publications. The reason for this difference in interest and attraction is due to a better understanding by the American engineer of how to make most directly the point of contact with the reader.

What does the manufacturer of electric lamp reflectors sell? Reflectors?

Certainly not. He is selling the better control of light rays, better conditions for workpeople, reduced current consumption, better and more accurate work, and so on.

What does the manufacturer of an electric motor sell? Electric motors?

Not if his selling is along the right lines. He is selling cleanliness, money-saving, freedom from rattling belts, forests of pulleys, simplicity of operation, and many other items of a similar character according to circumstances.

No goods are sold for what they are, but for what they will accomplish. What would be the use of building or buying engines unless something had to be driven or pulled? Nobody would want them to look at. Battleships are not built for fun, but for defence. Bridges are not built for pastime, but for convenience; and so on through the whole gamut of the engineering industry; but nobody would ever think so, to read most of the engineering advertising which is the direct cause of such prodigal waste of good money. To considerably improve the advertising is not a difficult matter. Most of it consists in simply answering one interrogation—"Why?"

All factory managers should insist upon the immediate installation of the Binco ventilating system.

Why?

Because, etc., etc.

All workers on lathes and similar machines should be protected from glaring lights by a Justit patent reflector.

Why?

Because, etc., etc.

Why should we not use the Justso reflector?

Because, etc., etc.

Essence of Good Advertising

Good advertising consists in answering the unasked questions of the reader. It means thinking ahead. For everything there is a reason. Give the reasons and you answer the unasked questions.

Back of every man's mind is antagonism to advertising. This antagonism i neutralized by the appeal to the weaknesses or to the strength of the reader Antagonism subdued, curiosity awakens Satisfy that curiosity and you create interest. Maintain interest, and from i confidence will emerge. Handle it intelligently and that confidence will in tur create business, and back will come you money from the advertising.

Apply the test to your own advertising. Does it create any desire in you t spend money? Would you buy the good if you were not an advertiser? Or, i you had to buy, would you buy fro your own firm because of the advertising?

Here's another test. Suppose you advertising is costing you $2,500 a year Would you pay that $2,500 to a representative to walk around and repeat t potential customers the same things a you say in your advertisements?

If either of these simple tests fail yo cannot be getting all the value fro your advertising expenditure that is possible.

CONTEMPORARY WAR ARTICLES

Embracing Information and Data Drawn from a Variety of Sources Relative to and Arising from the Prosecution of this Many-Sided European War

WOMEN AS SHELL MAKERS

DURING the past few days I have been privileged, says the Sheffield correspondent of the *Engineer*, London, England, in a recent issue, to pay a special visit to several of the big munition works in this district, and whilst, of course, little of what I say must be re-recorded, this may be said that there need be no anxiety about the rate at which shells of all sizes are being made. If no general movement is made toward the reinstatement of one day's rest in seven, it will not be because the production of war material is behind. Nothing of that kind is lagging. The various shell "shops"—factories they are—seem to have got into their stride; and it is a stride!

Munitions Plants a Revelation

Simply to pass through the works is a revelation. The armament works are charged by some people with losing time at the beginning of the war. They are losing none now. Not that I, for one, ever believed they were guilty of doing so. They could not run before the Government, and in the very early days of the war the Government appeared to be of the number who failed fully to apprehend that we were entering a long period of hostilities, for which we were by no means adequately prepared. The great armament firms simply waited for the signal from the Government to launch out upon a policy of works expansion in the interests of war output, and if that signal had been given sooner the task in which every munition works is now deeply involved would have been begun earlier.

However, the actual part played by e armament firms will be better under- ood when the smoke of war has clear- d and the country is able to review the hole circumstances in an atmosphere f calm philosophy. Then these firms ll have nothing to reproach themselves ith. What struck me most during my sit to the works was the increasing rt which is being taken by women and 's in the duty of making shells. At e place an official assured me, with an that seemed reminiscent of the old ejudice against female labor in such aces, that there were only about half dozen women workers on the prem- es; but then it happened to be a place ere the output is, generally speaking, r too heavy in character for women to ndle, and quite exceptional.

What Women Can Do

On the other hand, I saw some shops half filled with women and others with only a very small percentage of men. In the latter I noticed a curious thing—the women wore distinguishing caps, khaki, blue and red. In that fact there is more than just meets the eye, and a little explanation would not, perhaps, involve the revealing of any secrets. The women wearing khaki caps are plain shell turners. So long as their lathes are in order and everything works smoothly they are quite competent to go on adding to the production of ammunition for the men at the front. Those in blue caps are broadly called bench hands, as being much more skilled in the handling of the tools, while the red-capped women have passed a kind of examination in taking down and setting up the machines. This examination is, I believe, quite a severe test for them. Every piece of the lathe has to be laid on the ground and then picked out as it is required for setting up, and in order to ascertain whether or not the candidate for a red cap has the requisite intelligent knowledge of what is required of her, pieces from other machines are sometimes introduced amongst the actual pieces, and unless she detects these she fails to pass the inspection, and has to try again later on. The examinations, I hear, are working out very favorably for the women, who in some cases have entirely outshone men who have undergone a similar training. The management of one particular place was very loud in its praises of the work women are thus doing, declaring that they took a real intelligent interest in their work, with the result that, if anything went wrong with a lathe, they could tell at once where the trouble was and could remedy it.

Male Operator Attitude

I had a curious little experience, however. Wondering what the attitude of the ordinary skilled fitter—the mere man, was towards the red-caps, I questioned one. "Oh," he replied, "they do it like parrot work. They'll do just what they see you do, but why they have to do it, and what is really the matter, they don't know. They do all right with someone to supervise them, but they're not like us chaps, as knows what's what as soon as we look at it." All of which sentiments may possibly arise from a little professional jealousy; but, whatever view the ordinary fitter may take, he works well and loyally with the women just now in the interests of the great national need, leaving the question of delicate readjustments of industrial conditions to look after itself for the time being. There will, of course, be many difficulties beside that one to face after the war, but it is needless to worry about them at present.

Bad Timekeeping Less Serious

One director mentioned to me, with a shrug of the shoulders, that although his firm had not yet had recourse to the Tribunal, so far as the women workers are concerned, they had just seriously warned some of them that such a step would be taken if they did not improve their time-keeping. "Are they learning the tricks of some of the men?" I asked, meaning the slackers. "Yes," he replied, "they are learning the tricks of some of the men and adding to them all the tricks they seemed to know previously. When they get into the habit of bad time-keeping they are worse than the men. However, I think after the warning I have given them some improvement may be looked for. Personally, I am just passing into the third stage of my experience. At first I was enthusiastic about the employment of women as shell turners, then I became despondent about being ever able to make them really useful in that direction; now I am gradually returning to the condition of enthusiasm, and am in hopes that this time there will be permanent justification for it."

Women Workers' Welfare

One thing I should like to mention before passing from the subject, and that is the very admirable arrangements made on all hands for the comfort and accommodation of these women workers. Everywhere one sees splendidly equipped canteens coming into existence, and the old temporary arrangements done away with. Recently I was invited to inspect one of these canteens—of which, I believe, Vickers were the pioneers—at Cammell Lairds. The kitchen arrangements were perfect, the accommodation generally was most complete, the place was well lighted, warmed, and ventilated, and there were seats and tables for 400 at one sitting. This building, which was fitted with electric light, was only one of the firm's provisions for the welfare of the female employees. At some places the canteens will accommodate even larger numbers, and one which I have inspected just recently will seat no fewer than 2,000 at once.

The necessity for these innovations will, I fancy, revolutionize the whole idea of working conditions after the war, and the sort of thing that is now being done for women will be extended to much greater lengths than before for men and lads. It will probably prove to be one of the many lessons derived from the war conditions, and may help very materially to improve, where it is required, the relations between capital and labor, and by viewing matters from each other's point of vantage, assist in a clearer recognition of mutual interests. There are some difficult problems ahead for the two sides to face, and anything that will assist in smoothing the way for their amicable and permanent settlement should not be neglected.

What Employers Think

That, obviously, is a big subject, and one that cannot be lost sight of, though some are inclined to shelve it. The Master Cutler (Mr. W. H. Ellis, managing director of John Brown & Co.,) says that in Sheffield employers and workmen feel as strongly as anywhere what their rights are, and are prepared to urge them with all the arguments they possibly can, but that they never embark on strife without exhausting every argument that can be used. That, he says, has been their policy in the last few years, and they are determined that it shall continue, because it has given Sheffield a good and creditable name in the country and has established a feeling that if any work is placed in the city there is not likely to be any serious upheaval as between employers and employed. Mr. Ellis adds the hope that in ten years from the termination of the war he will be able to repeat those words. Everyone will endorse the hope, and everyone knows that, if only common sense prevails, it will be realized.

* * *

THE EVOLUTION OF THE "TANKS"

THE statements in the British House of Commons by the Secretary of State for War on Thursday, October 12, and by Dr. Macnamara, Parliamentary Secretary of the Admiralty, on Wednesday, October 18, in answer to a question by Captain Burgoyne, are probably the communications promised some time ago regarding the evolution of the "tanks" to be made with the view of giving credit where this was due.

It was made clear that E. H. Tennyson D'Eyncourt, C.B., the Director of Naval Construction, is entitled to full credit for designing this "formidable weapon of warfare." It would seem that a suggestion was made by several officers of the Royal Naval Air Service, as a result of experience in Flanders, to Winston Churchill, when the latter was first Lord of the Admiralty, in favour of the use of some armoured vehicle capable of traversing the irregular ground of "no man's land," of straddling over trenches and breaking down obstacles, and of scattering destruction from the guns within it, while being itself reasonably protected against gun fire.

Mr. Churchill, with that characteristic freedom of mind for the reception of new ideas, and courage for putting the potentialities of all such proposals to the test, gave heed to the suggestion, but in mechanics an idea is one thing; the evolution of the details of design to carry the idea into practical effect is quite another. The history of invention shows a great store of ideas incapable of application, as well as a rich record of long-entertained ideas successfully applied. The suggestion of caterpillar wheels is old, and has long been applied for the traction of guns over moderately irregular ground.

Foreign Claims Get Quietus

Many proposals for movable forts with such caterpillar wheels have been put forward from time to time, and we are amused to find that some of the suggestions by Americans have actually been published as illustrative of the system adopted in the "tanks" of the British Army now in use in France. The Americans claim that these are their invention, and, in fact, that they were manufactured in the United States. Germany also lays claim to the origination of the ideas. In connection with the question asked by Colonel Griffiths in the House of commons on the 12th inst., as to whether the "tanks" were entirely of British material, it is of interest to point out that everything was of British design and manufacture.

While it is not permissible to enter into any details regarding the wonderful engineering features in the design of the "tanks," it will be found that the ingenuity displayed in securing the long wheel based on the caterpillar chain principle is exceedingly novel and worthy of the highest tradition of British inventive ingenuity. When Mr. Churchill instructed Tennyson D'Eyncourt to prepare the design, the great limitations of former proposals were freely recognised, and there can be no doubt that the then First Lord of the Admiralty rendered great service in the masterful encouragement which he gave to the Director of Naval Construction.

During the preparation of the design and experiments Mr. D'Eyncourt suggested the appointment of a small Admiralty Committee, which should consult with representatives of the War Office as to the military conditions to be fulfilled. This Mr. Churchill at once agreed to making the Director of Naval Construction the chairman of the committee, whilst the secretary was Lieutenant (now Lieut.-Colonel) A. G. Stern, whose practical business ability, as Lloyd George said, had been invaluable in securing the manufacture on a considerable scale of this weapon of war. Colonel Swinton also, according to the Secretary of State for War, has been a most enthusiastic supporter of the idea, and the fact that it was carried through with such zeal was very largely due to the enthusiasm which he threw into the work.

All through the evolutionary stage, Mr. Churchill, the First Lord of the Admiralty, took a very active part, stimulating all concerned, and when the proposal for representatives from other Departments was made, Lloyd George gave the scheme his unstinted support. Mr. Balfour, when he went to the Admiralty as First Lord, equally supported the work of design and experiment. The other officers mentioned by Dr. Macnamara as assisting in the work were:—Commodore Sueter, Wing-Commander W. Briggs, Squadron-Commander T. G. Hetherington, W. O. Tritton (managing director of W. Foster & Co. Lieutenant W. G. Wilson, R.N.A.S (now Major Wilson, M.G.C.), P. Dale Bussell (Contract Department, Admiralty), Lieutenant A. G. Stern, R.N.A.S (now Lieut.-Colonel Stern, M.G.C.) Captain Symes, M.G.C., and F. Skeens Acting Assistant Constructor.

First Tank Enterprise

It was as far back as the summer o last year that the first "tank" wa ordered to be made from Tennyson D Eyncourt's design. The results of th trials were very satisfactory. The lat Lord Kitchener, as well as the Lord Commissioners of the Admiralty an Lloyd George, were particularly please with its attainments. When the Arm authorities became convinced of th utility of the machine on the battlefiel it was decided to build a number o such landships from the same design It was at this time very properly decided that the supervision of construction should be under the control of th Ministry of Munitions, and a committe of that Department was appointed t carry out the work. Lieut.-Colon Stern, who had before acted as secretary of the Director of Naval Construction's Committee, was made chairma of the new committee, while Colon Swinton took over direction of personnel. At the request of the Ministry o Munitions, and with the approval of th Admiralty, Tennyson D'Eyncourt continued as a member of this committe and was, and is still, chief technical adviser, and no doubt has worked out further developments of the "tank."

When it is possible to disclose the details of the design, it will no doubt b seen that in most of these details ther is great originality, and that nav architectural experience has in this, a in other repects, greatly assisted th army in the field. The secrecy with which the operations have been carried out merit high tribute, not only to those immediately engaged in the designing work, but also to the workers who have been employed in construction. Although Lloyd George could not enter into any details as to his association with the idea, it is only fair to say that that vigour which has ever actuated him was an important factor in the carrying through of the work of constructing the "tanks" which have been so invaluable, and promise to continue to be invaluable, at the front.—Engineering.

* * *

THE L.33 ZEPPELIN

ACCORDING to *The Times*, the Zeppelin which came down on September 24, in Essex, England, has a framework or skeleton composed of a series of longitudinal lattice-work girders running from end to end and connected at intervals by circular lattice-work ties, the whole structure being bound together and stiffened by means of a system of wires provided with arrangements which enabled them to be tightened up. The material used is an alloy of aluminum, resembling, but, it is said, inferior in quality to, that known as duralumin. At the largest point the framework has a diameter of 72 ft., and is of stream-line form, the bow being sensibly blunter than the stern, which, indeed, tapers off to a sharp point. The length of the vessel appears to have been 650 ft. or 680 ft., and the weight complete, with engines, fuel, guns and ammunition, is calculated at 50 tons. The hydrogen capacity was 2,000,000 cub. ft., and there were 24 ballonets, extending the whole length of the ship. The airship was built last July, and its cost is estimated by the Admiralty authorities at about a quarter of a million.

To enable the crew, which consisted of 2 men, to move from one part of the ship to another, a cat-walk ran along the keel, enclosed in an arched passage. It consisted of a narrow footway, 9 in. in width and made of wood—one of the very few examples of wood construction used—and provision for ventilation was made in the shape of shafts rising to the top of the ship. In all there were four gondolas—one forward, two amidships, and one aft. The forward one constituted, as it were the navigating bridge. It was divided into three parts. The first was set apart for the commander, and in it were concentrated the controls of the horizontal and vertical rudders at the stern (where also there were four stabilising fins to prevent rolling), the engine-room telegraphs, and the switches for the electrical release of the bombs. These last, of which 60 were carried, were arranged amidships, and the sliding door which was opened to allow them to fall can still be seen moving freely on its bearings.

Behind the commander's room in the forward gondola was a cabin for the wireless operator, measuring perhaps 6 ft. by 4 ft., and behind that again an engine-room containing a 240-h.p. Maybach-Mercedes engine having six vertical cylinders. Behind the engine was a clutch, a brake, and a reducing gear, through which the power was transmitted to a propeller shaft; a generator for the wireless installation was placed in front. One similar engine was carried in each of the gondolas amidships, and three in the aft gondola, all the engines having wireless generators attached. There were thus six engines, with an aggregate power of 1,440 h.p., and six propellers. Of the latter, three were worked from the aft gondola, one being placed in the centre at a point distant from the tail about one-fifth of the length of the ship, and the other two one on each side; two were driven from the side gondolas amidships, and the sixth was in connection with the forward gondola.

To reduce air resistance a stream-line form was given to the propeller stays by the aid of a thin two or three-ply wooden casing shaped in the proper way. The amount of petrol carried was 2,000 gallons, and the speed is supposed to have been about 60 miles an hour in a still atmosphere. The armament, apart from the bombs, consisted of nine quick-firing guns. Of these, two larger than the others, were mounted on the roof, two were in the forward gondola, one each in the amidships gondolas, two in the aft gondola, and one in the tail. The lightness of the construction is shown by the fact that the huge tail, still containing the remains of the gun platform, can easily be rolled over by one man.

GERMANY OUSTED FROM AUSTRALIAN METAL INDUSTRY

THE attack on the German metal octopus, which was first made by Prime Minister Hughes, of Australia, has excited considerable interest all over the world. It is not too much to say that the manner in which the campaign was instituted, carried out, and pushed in spite of tremendous obstacles to a successful conclusion, first revealed the strength of the Australian Prime Minister, and no doubt introduced him to the world at large. Following quickly upon the heels of the unmasking of Germany's position, came in rapid succession a number of Parliamentary Acts which took completely the metal industry out of the hands of Germany, and it is not too much to say that as far as Britain is concerned, never again will Germany control the metal market of the world. Some of the Parliamentary Laws put through the Australian National Parliament may be briefly stated:—

Cancellation of all mineral and metal contracts with enemy companies and firms by the Commonwealth Government of Australia. This Act has been lately adopted by the British Government.

Dissolution of the Lead Convention controlled by Germany, which determined the output and price to producer and consumer of all Australian lead.

Dissolution of the Zinc Combine, by which Germany controlled the world's spelter market, price and output, and manipulated the market so as best to serve Germany.

Complete destruction of the gigantic Aaron Hirsch and other German Trusts which controlled the copper industry in Australia.

Destruction of all enemy agencies controlling tin, molybdenite, wolfram, and other metals.

In connection with the German control over lead, zinc and copper, it cannot be too strongly stated that it was complete, and affected not only the producer and the consumers in Britain and elsewhere, but by fixing the world's price for the metals, and limiting the output it directly controlled and affected employment and wages.

England was slow to follow the lead set by Australia, but eventually did so, thus making a uniform metal policy all over the British Empire. The ground having thus been cleared and the German influence rooted out completely, the work of constructing the whole matter on a purely Australian, and British foundation has been entered upon promptly and systematically.

NICKEL COMMISSION PREPARING REPORT

THE report of the Ontario Nickel Commission will, it is expected, be submitted to the Legislature at the next session. The members of the commission have practically completed their investigations and are now engaged in the preparation of the report.

While the labors of the commission are associated in the public mind largely in connection with means of refining nickel in Ontario and controlling the export of the unrefined nickel, by no means the least important part of its work has had to do with the shaping up of a comprehensive policy of mining taxation applied to all Ontario's great mineral resources. If this part of the report is ready in time Hon. G. Howard Ferguson may be able to bring down the promised tax legislation at the coming session. Meanwhile the plant being established at Port Colborne on Lake Erie for the refining of Ontario nickel by the International Nickel Co., is under way.

PROGRESS IN NEW EQUIPMENT

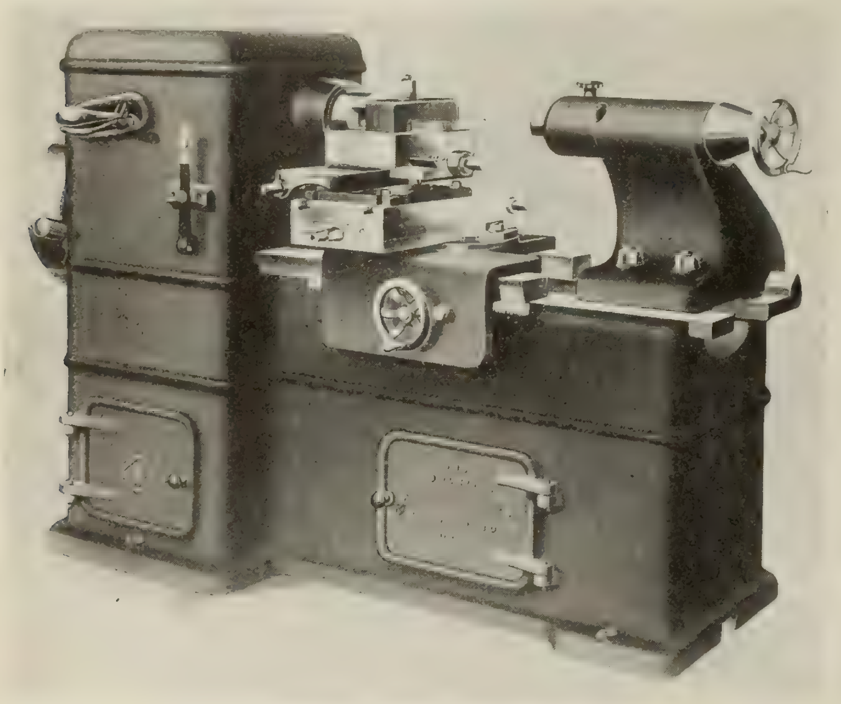
A Record of New and Improved Machinery and Accessories for the Machine, Pattern, Boiler and Blacksmith Shops, Planing Mill, Foundry and Power Plant

CUTTER RELIEVING MACHINE

THE Cleveland Milling Machine Co., Cleveland, O., is now building a cutter relieving machine which is illustrated and described herewith. It has been developed for the special purpose of relieving formed cutters up to 13½ in. in diameter with any number of teeth from 1 to 28 inclusive, and any even number of teeth from 28 to 42 inclusive, giving straight, side or end relief on all cutters which come within the capacity of the machine. It will be noted from the illustration that box-type construction has been adopted for all large members including the base, bed, headstock and tailstock in which metal is generously distributed in both the walls and webs to provide ample strength.

Power is provided by a 14-in. pulley which carries a 3-in. belt and runs at 460 revs. per min. From this pulley the drive is through a set of reverse gears to a tumbler pinion, from which five selective spindle speeds are obtained, the drive being transmitted through a worm-wheel of large diameter which is mounted directly upon the spindle. The machine can be started, stopped or reversed by manipulating a single hand lever. The spindle is machined from a high-carbon steel forging and is 3½ in. in diameter at the largest point. It runs in solid tapered phosphor-bronze bear- compensating for wear. The taper hole in the spindle is No. 10 B. & S., and the spindle is bored to accommodate a 1-in. draw bolt.

The tailstock spindle is 2½ in. in diameter and is bored No. 10 B. & S. taper; it has a maximum adjustment of 7 in. by means of hand-wheel. Alignings which are provided with means of ment of the tailstock is maintained through one 90-degree V-way at the back of the bed, the flat bearing at the front being 2 in. wide by 15 in. in length. The tailstock may be locked in any desired position by two clamping bolts located in front of the tailstock. The rear carriage bearing is 3 in. in width and the front bearing 6 in. in width; the carriage is gibbed longitudinally to the front bearing and the apron is cast integral with the carriage. The carriage is provided with a maximum longitudinal adjustment of 13 in., which is obtained by operating a hand-wheel. Each complete single turn of this wheel gives a longitudinal carriage movement of 1 in.



CUTTER RELIEVING MACHINE.

A single throw cam giving relief from zero to ¾ in. is carried by a cam slide swivel plate which is adjustable to any degree which is desired. Tapered gibs are provided for taking up wear on all slides. The forming tool may be quickly positioned in the proper relation to the cutter by means of a double adjustable toolpost which his graduated t 0.001 in. Provision is also made fo bringing the cutter to be relieved in th proper relation to the form tool without loosening the cutter on the arbo or loosening the change gears on th end of the machine. Corrugated adjustable wedges on top of the toolpos provide for adjusting the amount o stock that is ground off the forming too from ¾ to ¼ in. If desired, this cutter relieving machine may be motor driven, in which case a 3 horse-powe constant speed motor is employed, whic is mounted on top of the headstock. Th weight of the machine is approximatel 7,000 lbs.

* * *

HEAVY DUTY MANUFACTURING LATHE

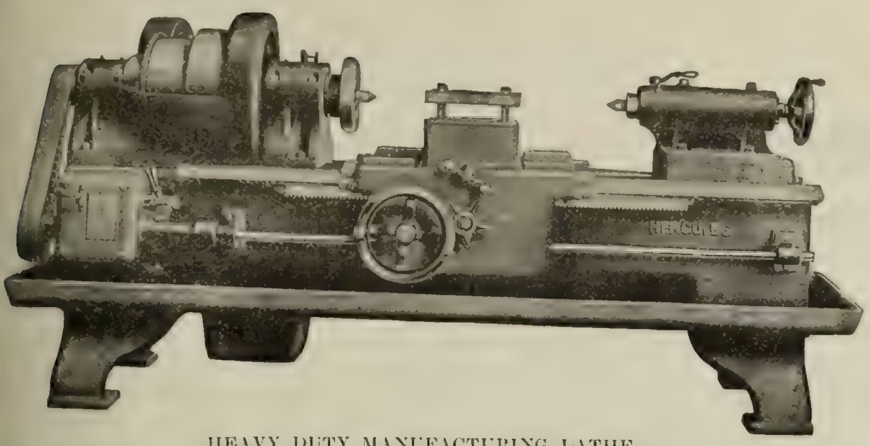
THE advantages and economies of th single purpose manufacturing lathe having been convincingly demonstrated i the manufacture of shells, it was but matter of time before refined designs this type of machine would be availabl for use in general machine work. Th increasing tendency in modern shops t confine thread cutting to one machin is constantly widening the field of th simple lathe and in the accompanyin illustration is shown the Hercules heav duty manufacturing lathe which is th refined development of a machine or ginally developed with the single idea turning shells rapidly.

While capable of swinging 21 in. ov the vees, the machine possesses th weight and proportions of the avera 24 in. lathe, with correspondingly i creased rigidity, and lessened cost manufacture.

The headstock spindle is a fifty poi carbon steel forging, ground on all bea ing surfaces, and furnished when r quired with a 2¼ in. hole. The bea ings are of the chain oiling type, a are provided with sight feed oilers sho ing the amount of oil in the bearing Spindle thrust is taken by a harden steel washer against the rear bearin adjustment being made by a nut at t rear. A large diameter two-step co pulley capacity of high speed too while five changes of feed are provid through a feed change box actuated chain drive from the tail of spindle.

A splined shaft and worm gear op ate the longitudinal travel of the sa dle by rack and pinion, all gears bei steel forgings with front and rear bea ings, and a friction cone is embodied the system to eliminate breakages. An adjustable collar on the splined shaft operates a knock off for stopping the movement of carriage.

The tailstock casting is of the extension barrel type providing clearance over the carriage bridge when turning short work, and is clamped in position with four bolts. The spindle is fitted with a No. 5 Morse taper and is clamped by a plug binder which does not affect alignment.



HEAVY DUTY MANUFACTURING LATHE.

The bed is capable of withstanding the most severe twisting strains as a result of being closely cross-ribbed with box type sections. It is made of semi-steel and has a large vee in front for guiding the carriage, while the headstock and tailstock are guided by the rear vee.

The standard length of bed is 8 ft.; wing over spindle, 21 in.; over vees, 11 n.; front spindle bearing, 5 in. x 9 in., ear, 4 in. x 8 in., distance between centres, 38 in.; cone pulleys, 14 in. and 17 n. dia. for 5-in. belt; tailstock spindle, 3½ in. dia. x 6 in. travel, and No. 5 orse taper, five feeds per revolution, rom .02 in. to .10 in.: net weight, 4,750 s.

The makers of this machine are the Iimoff Machine Co., 128 Mott street, ew York.

* * *

HACK SAW BLADE GRINDER

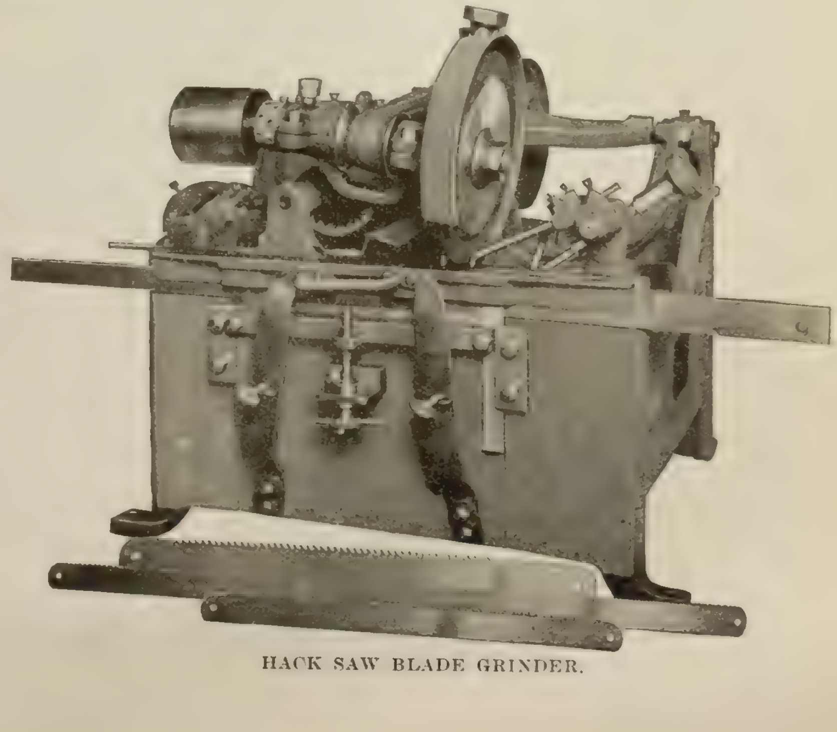
I is now possible to effect considerable onomy in the use of hack saw blades re-sharpening them on specially de- ned grinding machines. The compar- vely short life of hack saw blades and e inability to use them more than once parts interest to the machine shown the accompanying illustration, by ans of which used blades may be used er again eight or ten times.

The machine is full automatic, blades the same width and number of teeth r inch being fed through without opping it or changing adjustments; the standard capacity ranges up to 36- i long x 2 in. wide, with pitch as fine a 33 per in. The solid iron frame is in o piece. Main drive shaft runs on high grade babbitt, while the bearings of the grinding wheel are of bronze, all wearing parts being of steel. Work holding vise is of spring type with steel guides and tension screws with lock nuts.

Extending across the back of the machine is the main drive shaft from which a belt drive extends to the wheel shaft at the front end of a swinging arm, the rear end of which is supported between hardened steel pivots mounted in a segmental member. This allows the grinding wheelhead to be set at such an angle as to allow the edge or corner only of the grinding wheel to come in contact with the face of the tooth, and the opposite edge or corner on the back of the tooth; the wear on the wheel due to this arrangement keeps it always dressed to a knife edge. Two adjustments control the depth of the grinding and the amount ground off the back of the teeth.

The movement or feed of the blade is controlled by a slotted eccentric at the left of the machine, driven by worm gearing from the main drive shaft, suitable scales on the eccentric allowing rapid adjustment. The proper combination of the various adjustments enables the grinding wheel to be so perfectly timed that when the wheel has traveled all the way down the face of the tooth, the cam comes into action and raises the wheel as it travels up over the back of the tooth.

The blade is positively fed through the machine by a double pawl positive feed movement, which continues feeding even where teeth are broken out of the blade. In actual work, fifty to sixty-five teeth per min. are finished, and one wheel will resharpen 200 to 300 blades, when taking an average cut on 18 in. blades. The belt driven machine as illustrated weighs 188 lbs., occupies a space of 22 in. x 24 in., and is built by the Wardwell Mfg. Co., Cleveland, O.



HACK SAW BLADE GRINDER.

SOME CLASS TO UNCLE

LITTLE JIMMY came to Toronto from his Northern Ontario home where colored folks are hardly ever seen. One day when he was out walking with his Uncle Bob, there happened to pass a colored woman, and, as a result, the following conversation took place:-

"Say, Uncle, why did that woman black her face?" said Jimmy.

"Why, she hasn't blacked her face—that's her natural color," said Uncle.

"Is she black like that all over?" asked Jimmy.

"Why, yes."

"Gosh, Uncle, you know everything, don't you?"

EXHIBITION OF ENEMY PRODUCTS AT TORONTO

WHILE it is meantime impossible to fully estimate results likely to accrue from the two-week period during which samples of enemy products were on exhibition in Toronto, there is little doubt that some useful missionary work has been done in the matter of directing the attention of our manufacturers to the value of export business, and in bringing vividly before them the wide variety of trade openings available in overseas markets. To what extent steps will be taken by Canadian industries to share in the different offerings remains to be seen, nevertheless in view of the intelligent interest aroused, and notwithstanding such immediate disabilities as high production cost comparatively, and lack of our own merchant marine, definite, even if slow and modest, progress may be expected. Not a few manufacturers visiting the Exhibition and who had been exercising themselves with regard to the possibilities of doing business in foreign markets expressed their intention of taking up the proposition seriously as a result of what they had seen. Others again were able to appropriate ideas from different exhibits which would help them to modify existing production methods, and thereby more effectually embrace home market opportunities, if not those abroad. Many samples of exhibits were loaned to manufacturers for further investigation.

The total attendance at the local Exhibition was 2,620, making the third highest in point of numbers of all the cities visited in the United Kingdom and Canada. The various attendances to date are as follows: Manchester, 3,491; Birmingham, 3,341; Toronto, 2,620; Glasgow, 2,014; Montreal, 1,714; Sheffield, 1,203; Dublin, 1,173; Leeds, 1,149; Liverpool, 1,079; and Nottingham, 1,050. Leicester and Bristol were both under the thousand mark. The attendance at Toronto included, of course, visitors from outside towns, such as Hamilton, Guelph, Kitchener, Galt, London, Peterborough, etc. In the totals of all of the cities named, the surrounding districts are of course also included. A circular entitled, "Questions for Canadian Manufacturers" was distributed at the Exhibition on behalf of the Department of Trade and Commerce, Ottawa, the response to which has so far been quite gratifying. A considerable number of the circulars have already been filled in and returned to Ottawa for attention. A week's stay in London, Ont., commencing Nov. 20, followed by a like period in St. John, N.B., completes the programme so far as Canada is concerned. With the evidence before it that a display of exceedingly cheap, varied class and flimsy natured products merited a keen and widespread interest on the recent occasion, it behooves our Department of Trade and Commerce to immediately plan for an even larger display, and that of more substantial enemy products in the near future, bearing in mind particularly the lines through which Germany cemented her hold on our own home market.

CANADIAN MUNITIONS OUTPUT BEING ACCELERATED

A RECENT statement issued by the Imperial Munitions Board expresses the view that our metal-working plants are exerting themselves to the fullest extent possible to meet the demand for both quantity and quality shell output irrespective of size and type. It is further of interest to note that not only are delivery dates called for on completed contracts several months removed from this period of writing, but to those firms showing special dispatch in performance, the largest slices of renewal orders have been promised. In the comparatively early stages of shell-making in Canada, we were understood to have "struck a stride" that would be hard to beat either by ourselves or our confreres in the industry. That we have got rid of that idea, our meantime capacity and accomplishment amply demonstrate, and this notwithstanding such disabilities as male labor shortage.

While the receipt and installation of the necessary manufacturing equipment is not now subject to what might be termed the almost interminable delays of the early stages, we are disposed to think that in many branches of the industry the "labor dilution"—the accession of female operators to the ranks of producers, is beginning to show a marked effect on the total output. It is the policy of the Munitions Board to develop this feature, which, in addition to its being at once a compensator and stimulator of recruiting for overseas service, is doubtless inspired by the all-round success of the "dilution" movement in Great Britain.

The hearty response which Canada has given to the financing of Britain's munitions orders is being reflected in the prodigality of the latter, and at least while the war lasts the reciprocal relationship may be expected to continue operative.

IS A CANADIAN SHIPBUILDING COMBINE COMING?

FOLLOWING hard on the change of management of the Davie Shipbuilding & Repair Co., Levis, Que., comes advice that control of the Western Drydock & Shipbuilding Co., Port Arthur, Ont., has been secured by Canadian interests. In view of the foregoing we should not be surprised to find in the very near future other well-known plants of a like nature undergoing a change of personnel in their administration, and losing their identity except as to location in one gigantic merger. It is generally believed that the Canada Steamship Lines management are behind the movement towards a consolidation of the various interests. Such a programme will, we believe, contribute materially to both the development of our shipbuilding industry and the creation of a worth-while Canadian Merchant Marine.

INDUSTRIAL NOTABILITIES

THOMAS AHEARN, Electrical Engineer, Ottawa, Ont.; president, Ottawa Investment Co.; president Ottawa Land Association; president, Ottawa Car Mfg. Co.; president, Ottawa Gas Co.; president, Ottawa Electric Co.; president, Ottawa Light, Heat & Power Co.; president, Ottawa Electric Railway Co.; president, Ottawa Traction Co.; president, The Capital Mica Co.; director, Canadian Westinghouse Co.; director, Bell Telephone Co. of Canada; vice-president, Ahearn & Soper, Ltd.; vice-president, The Wallace Realty Co. and the Ottawa Building Co., was born at Ottawa, June 24, 1855, son of John and Honora (Power) Ahearn. He was educated in the Public Schools, Ottawa. Originally a telegraph operator at Ottawa and New York, and later (1880) manager, Bell Telephone Co., Ottawa, he, in 1882, entered into partnership with W. Y. Soper under firm name of Ahearn & Soper, electrical engineers and contractors; some of the largest electric works in Canada have since been built and equipped by them.

THOMAS AHEARN.

Mr. Ahearn was one of the founders, Chaudiere Electric Light & Power Co. in 1886; this concern being merged in Ottawa Electric Co., 1895, and, with the Ottawa Gas Co., absorbed by the Ottawa Light, Heat & Power Co. He was also one of the founders and is president of the Ottawa Electric Railway Co., the pioneer venture of its kind in Canada. He is a member, American Institute of Electrical Engineers; Old Time Telegraphers and Pioneer Telephone Associations; Governor, St. Luke's Hospital, etc., etc. His clubs are: Rideau; Ottawa Golf; Ottawa Hunt; Ottawa Country and Laurentian; traveling is, however, his favorite pastime. His residence is "Buena Vista," Laurier Ave., Ottawa, Ont.
